GPU Computing and Programming

Andreas W Götz

San Diego Supercomputer Center
University of California, San Diego

Friday, January 5, 2021, 1:00 pm to 3:00 pm, PDT

SDSC SAN DIEGO SUPERCOMPUTER CENTER

UC San Diego

Training overview

We will cover the following topics

- GPU hardware overview
- GPU accelerated software examples
- GPU enabled libraries
- CUDA C programming basics
- OpenACC introduction
- Accessing GPU nodes and running GPU jobs on SDSC Expanse

What is a GPU?

Accelerator

- Specialized hardware component to speed up some aspect of a computing workload.
- Examples include floating point co-processors in older PCs, specialized chips to perform floating point math in hardware rather than software. More recently, Field Programmable Gate Arrays (FPGAs).

Graphics processing unit

- "Specialist" processor to accelerate the rendering of computer graphics.
- Development driven by $150 billion gaming industry.
- Originally fixed function pipelines.
- Modern GPUs are programmable for general purpose computations (GPGPU).
- Simplified core design compared to CPU
  - Limited architectural features, e.g. branch caches
  - Partially exposed memory hierarchy

Tseng Labs ET4000/W32p 1991

Voodoo3 2000 AGP card 1999

GeForce 6600 GT Personal Cinema 2004

NVIDIA GeForce GTX 280 2008

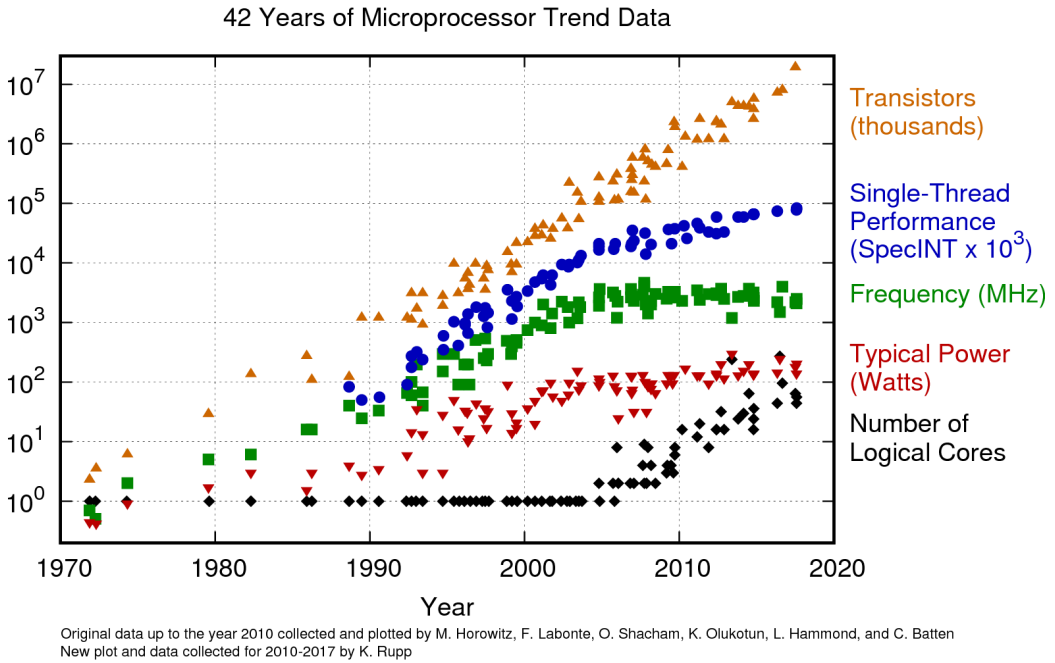
Why is there such an interest in GPUs?

Moore's law

- Transistor count in integrated circuits doubles about every two years.
- Exponential growth still holds (see figure).
- However…

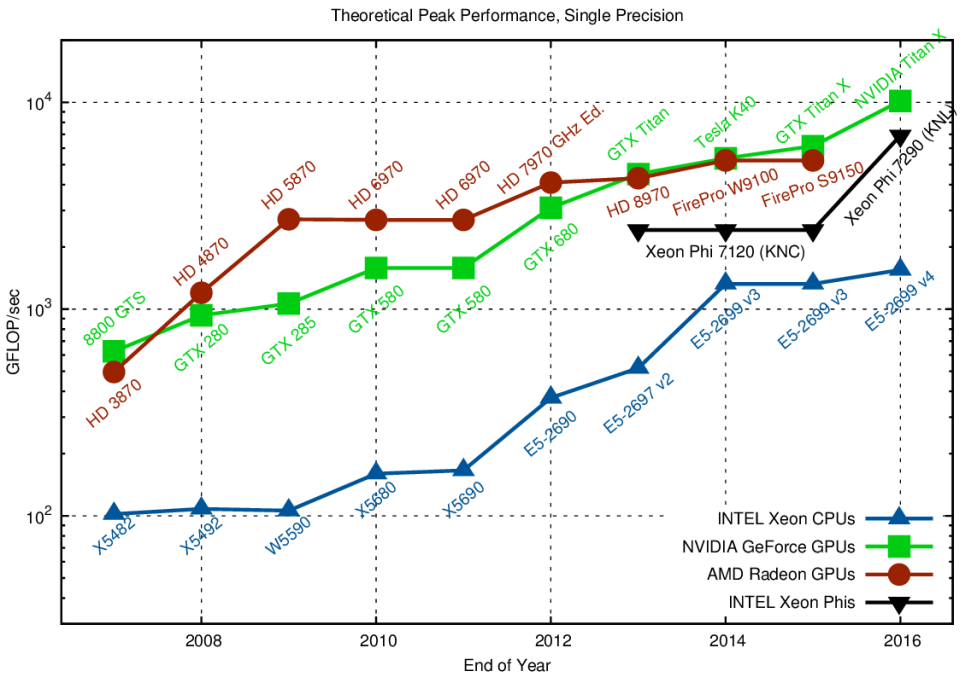
Trends since mid 2000s

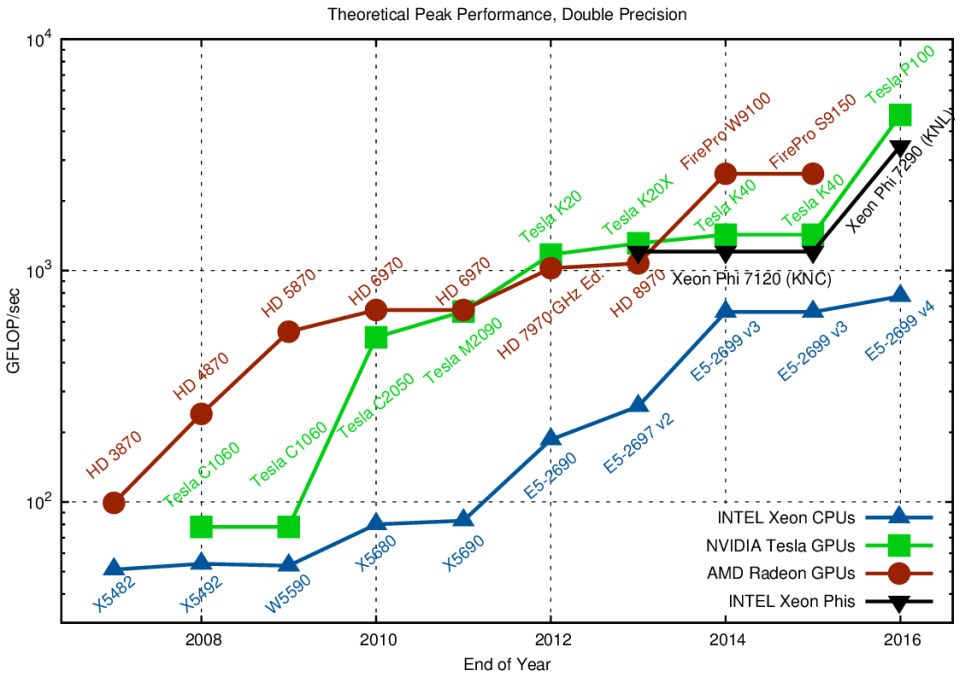
- Clock frequency constant.
- Single CPU core performance (serial execution) roughly constant.
- Performance increase due to increase of CPU cores per processor.
- Cannot simply wait two years to double code execution performance.
- Must write parallel code.



Source:
https://www.karlrupp.net/2018/02/42-years-of-microprocessor-trend-data/

Why is there such an interest in GPUs?

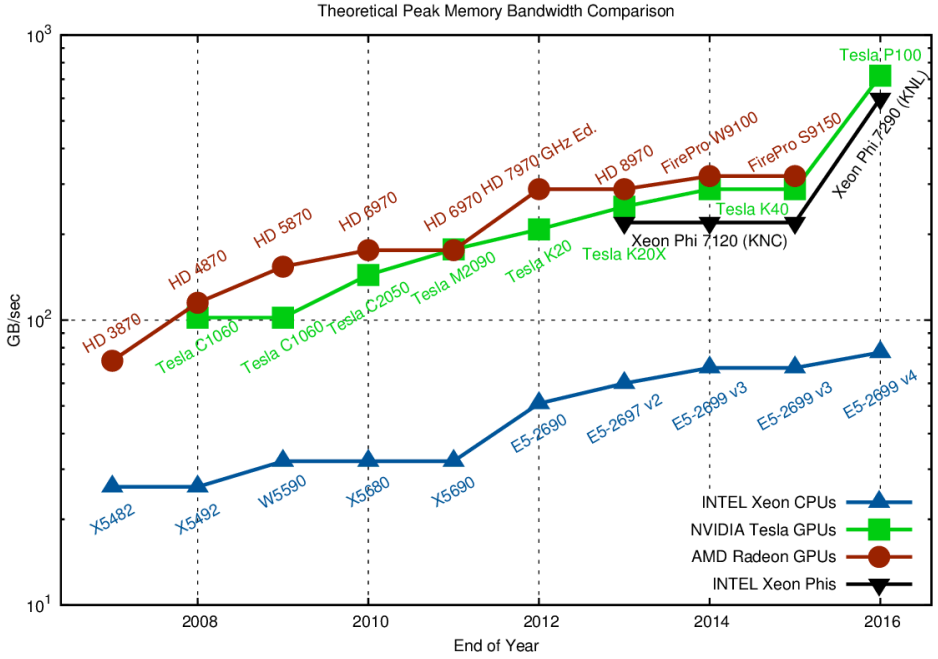


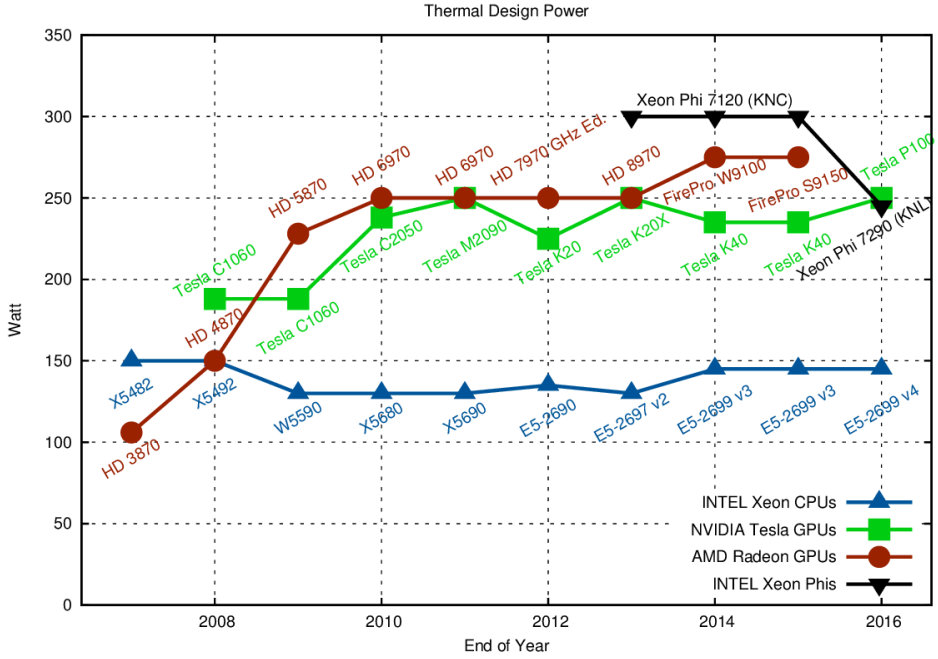


- GPUs offer significantly higher 32-bit floating point performance than CPUs.
- Datacenter GPUs also offer significantly higher 64-bit floating point performance than CPUs.

Figures source: https://www.karlrupp.net/2013/06/cpu-gpu-and-mic-hardware-characteristics-over-time/

Why is there such an interest in GPUs?

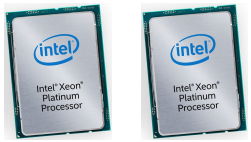




- GPUs have significantly higher memory bandwidth than CPUs.
- Given power consumption, a fair comparison would be a single GPU to 2-socket CPU server.

Figures source: https://www.karlrupp.net/2013/06/cpu-gpu-and-mic-hardware-characteristics-over-time/

Comparison of top X86 CPU vs Nvidia V100 GPU



Aggregate performance numbers (FLOPs, BW)	**Dual socket Intel 8180 28-core (56 cores per node)**	**Nvidia Tesla V100, dual cards in an x86 server**
Peak DP FLOPs	4 TFLOPs	14 TFLOPs (3.5x)
Peak SP FLOPs	8 TFLOPs	28 TFLOPs (3.5x)
Peak HP FLOPs	N/A	224 TFLOPs
Peak RAM BW	~ 200 GB/sec	~ 1,800 GB/sec (9x)
Peak PCIe BW	N/A	32 GB/sec
Power / Heat	~ 400 W	2 x 250 W (+ ~ 400 W for server) (~ 2.25x)
Code portable?	Yes	Yes (OpenACC, OpenCL)

A supercomputer in a desktop?

ASCI White (LLNL)

- 12.3 TFLOP/sec – #1 Top 500, November 2001.
- Cost – $110 Million USD (in 2001!)

SDSC login02

- 2.8 PFLOP/sec aggregate
- 36 nodes 2 x Nvidia K80
  5.5 TFLOP/sec DP, 16.4 TFLOP/sec SP (each node)
- 36 nodes 4 x Nvidia P100
  18.8 TFLOP/sec DP, 37.2 TFLOP/sec SP (each node)
- Cost – $25 Million USD ($14 Million Hardware)

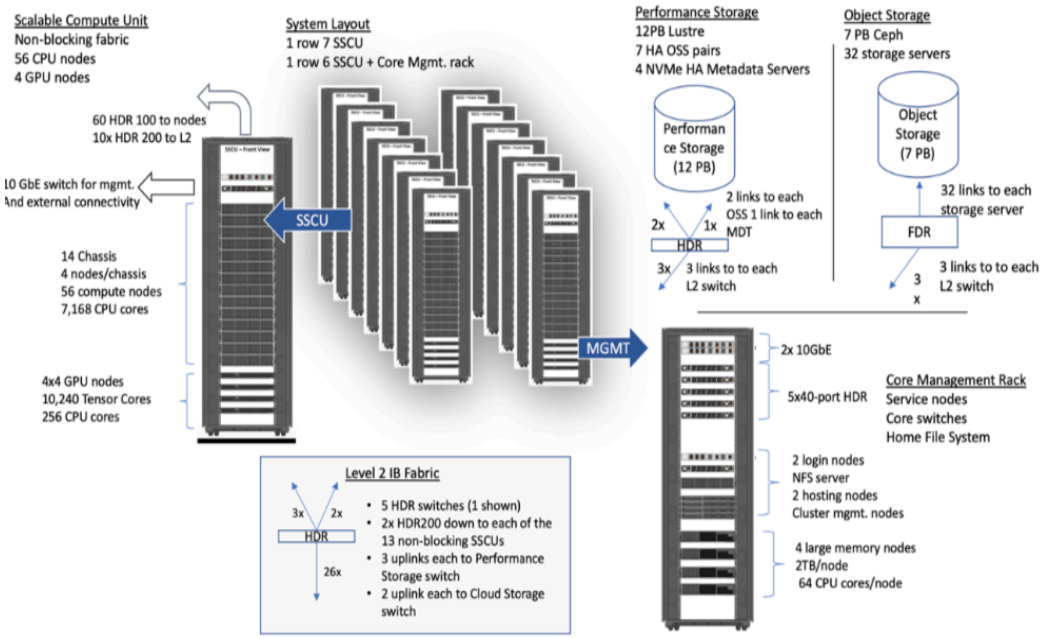
DIY 4 x Nvidia RTX 2080 box

- 1.3 TFLOP/sec DP
- 40.0 TFLOP/sec SP
- Cost – ~ $5 Thousand USD

Expanse Heterogeneous Architecture

System Summary

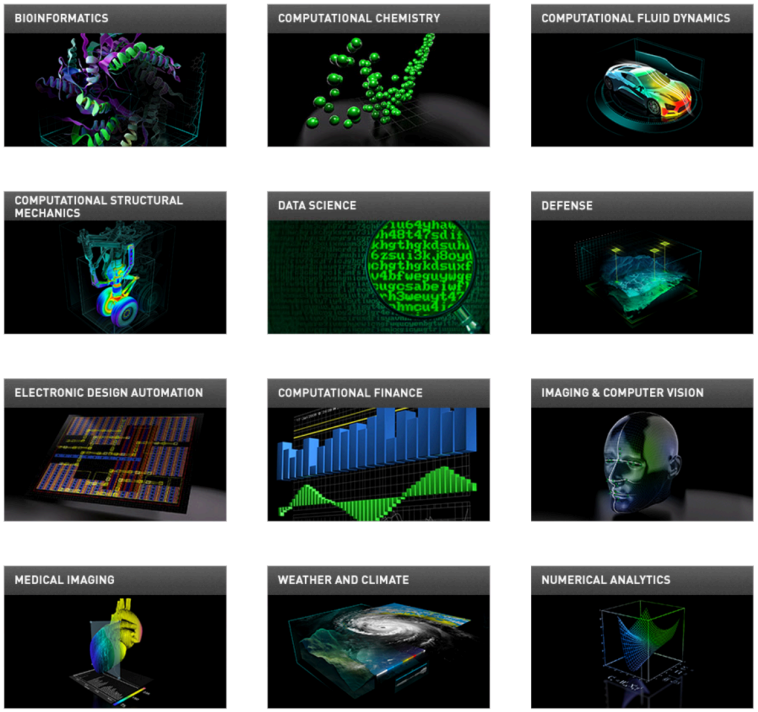
- *13 SDSC Scalable Compute Units (SSCU)*
- *728 x 2s Standard Compute Nodes*
- *93,184 Compute Cores*
- *200 TB DDR4 Memory*
- *52x 4-way GPU Nodes w/NVLINK*
- *208 V100s*
- *4x 2TB Large Memory Nodes*
- *HDR 100 non-blocking Fabric*
- *12 PB Lustre High Performance*
- *Storage*
- *7 PB Ceph Object Storage*
- *1.2 PB on-node NVMe*
- *Dell EMC PowerEdge*
- *Direct Liquid Cooled*



GPU accelerated software

Examples from virtually any field

- Exhautive list on https://www.nvidia.com/en-us/data-center/gpu-accelerated-applications/
- Chemistry
- Life sciences
- Bioinformatics
- Astrophysics
- Finance
- Medical imaging
- Natural language processing
- Social sciences
- Weather and climate
- Computational fluid dynamics
- Machine learning, of course
- etc...



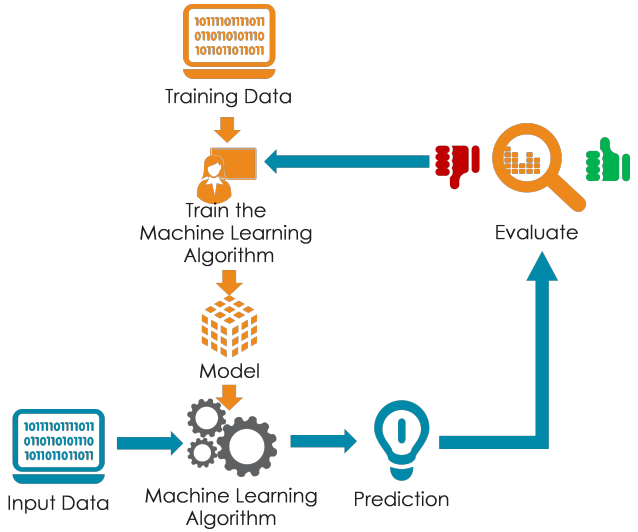
Machine learning and GPUs

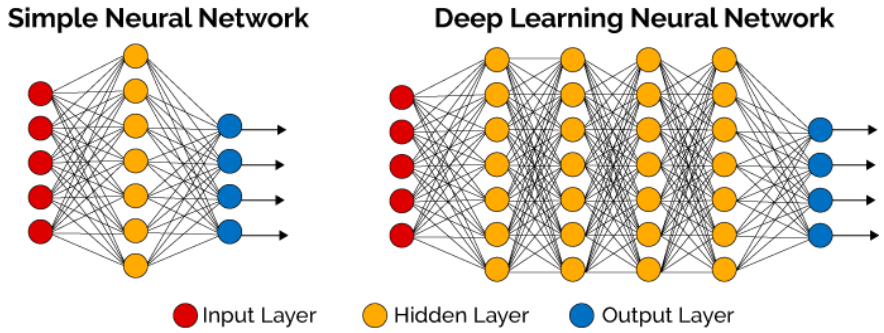
Machine learning

- Estimate / predictive model based on reference data.
- Many different methods and algorithms.
- GPUs are particularly well suited for deep learning workloads

Deep learning

- Neural networks with many hidden layers.
- Tensor operations (matrix multiplications).
- GPUs are very efficient at these (4x4 matrix algebra is used in 3D graphics)
- Half-precision arithmetic can be used for many ML applications, at least for inference.
- ML frameworks provide GPU support (E.g. PyTorch, TensorFlow)



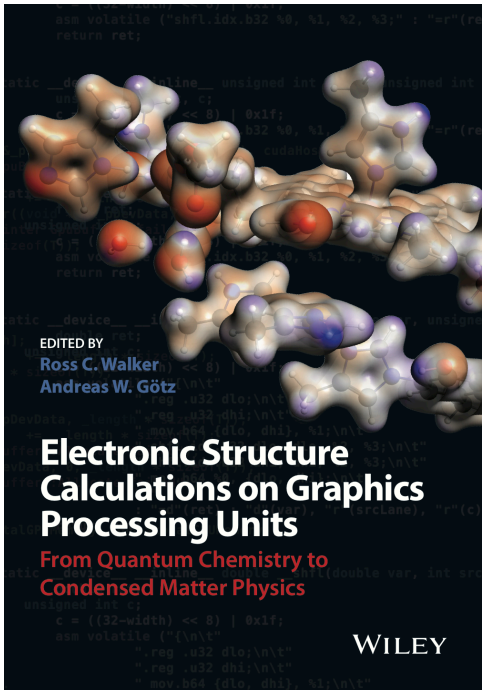


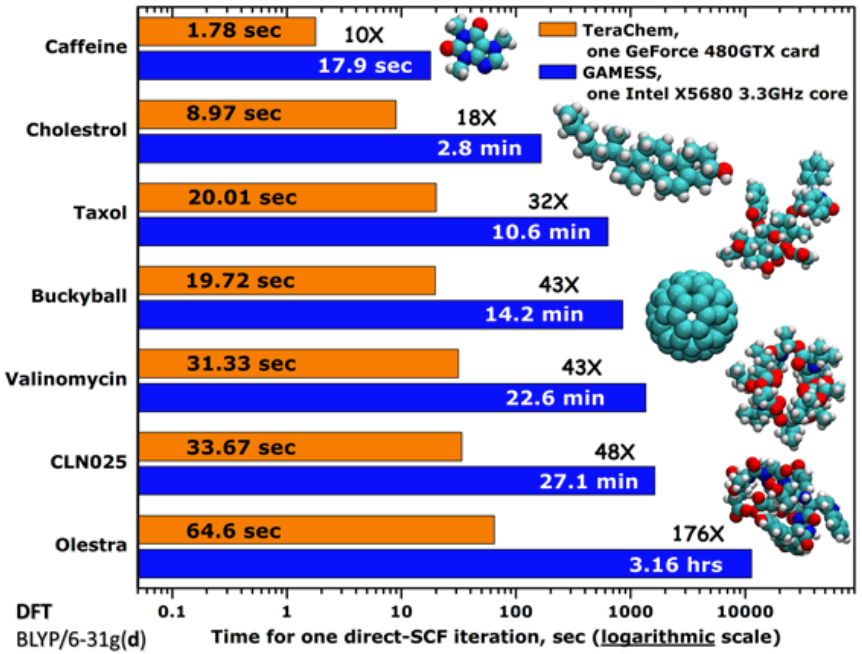
Benchmark examples

Benchmark examples

Quantum chemistry

- Compute molecular properties from quantum mechanics (TeraChem code)

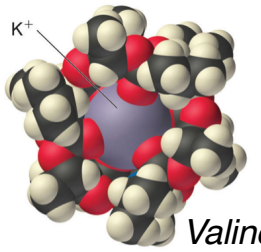




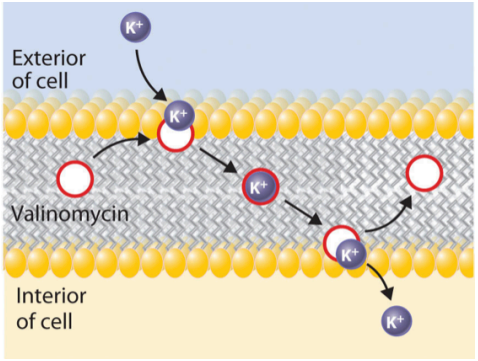
Benchmark examples

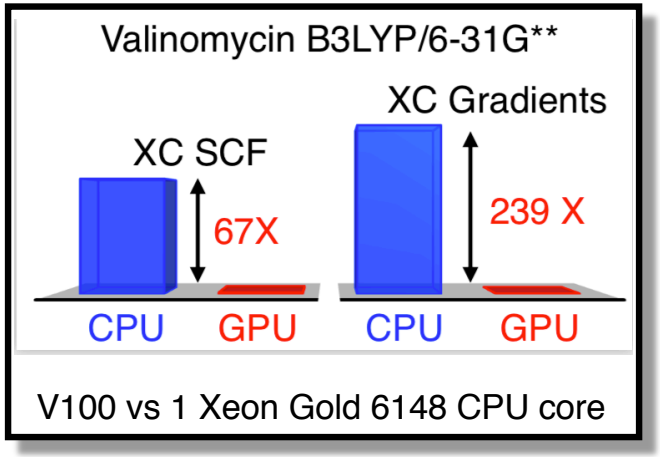
Quantum chemistry

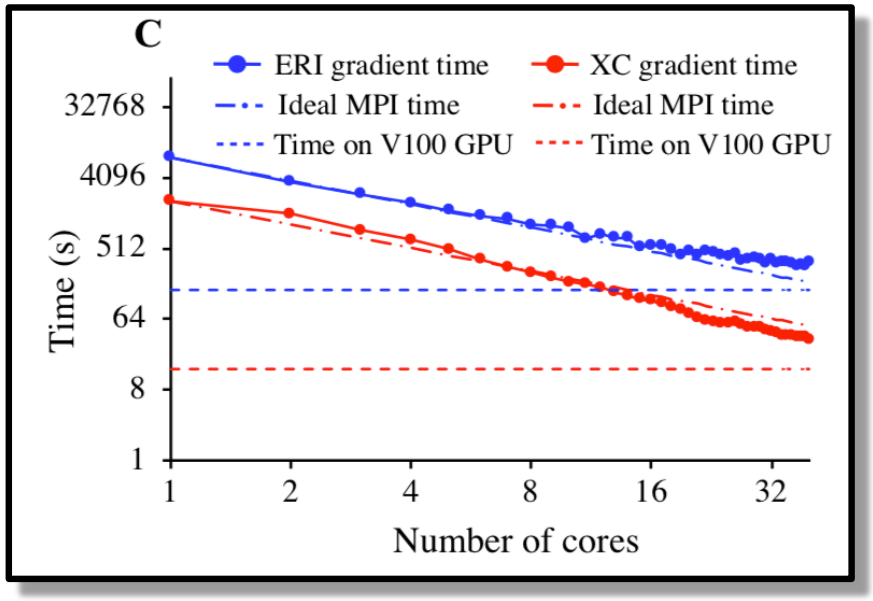
- Compute molecular properties from quantum mechanics
- Example: QUICK code (open source, developed by Merz and Goetz labs)
- https://github.com/merzlab/QUICK



Valinomycin







Benchmark examples

$$E[\rho] = T_s[\rho] + \int d\mathbf{r}\rho(\mathbf{r})v_{ext}(\mathbf{r}) + \frac{1}{2}\int d\mathbf{r}d\mathbf{r}'\frac{\rho(\mathbf{r})\rho(\mathbf{r}')}{|\mathbf{r}-\mathbf{r}'|} + E_{xc}[\rho]$$

QUICK Density Functional Theory

- Numerical quadrature of exchange-correlation potential and energy

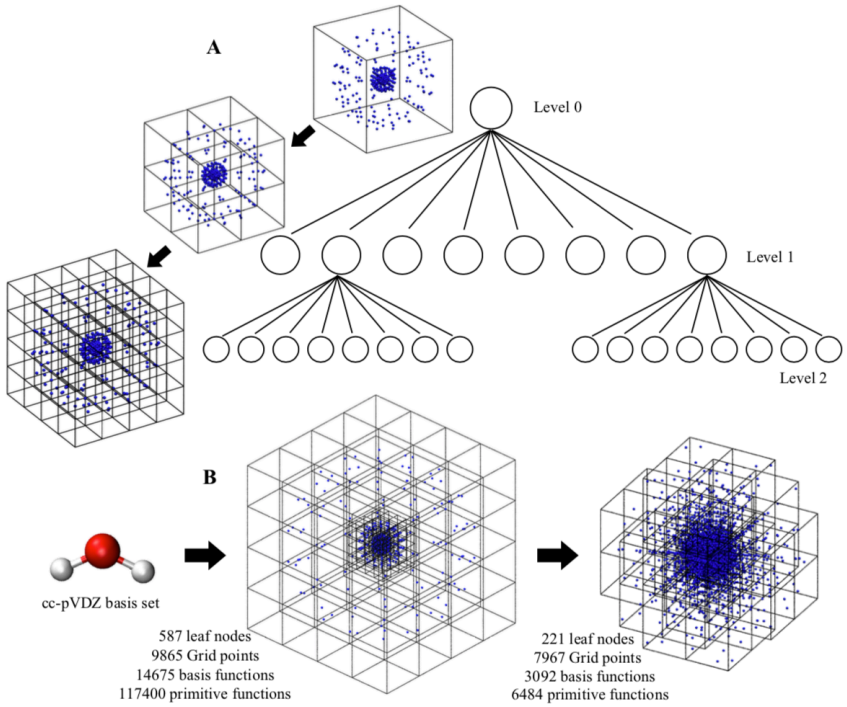
$$E^{xc} = \int f(\rho_\alpha, \rho_\beta, \gamma_{\alpha\alpha}, \gamma_{\alpha\beta}, \gamma_{\beta\beta})dr,$$

$$\int d\mathbf{r} f(\mathbf{r}) \approx \sum_i \omega_i f(\mathbf{r}_i)$$

- See *J. Chem. Theory Comput.* **16**, 4315-4326 (2020) https://dx.doi.org/10.1021/acs.jctc.0c00290

Parallel numerical quadrature

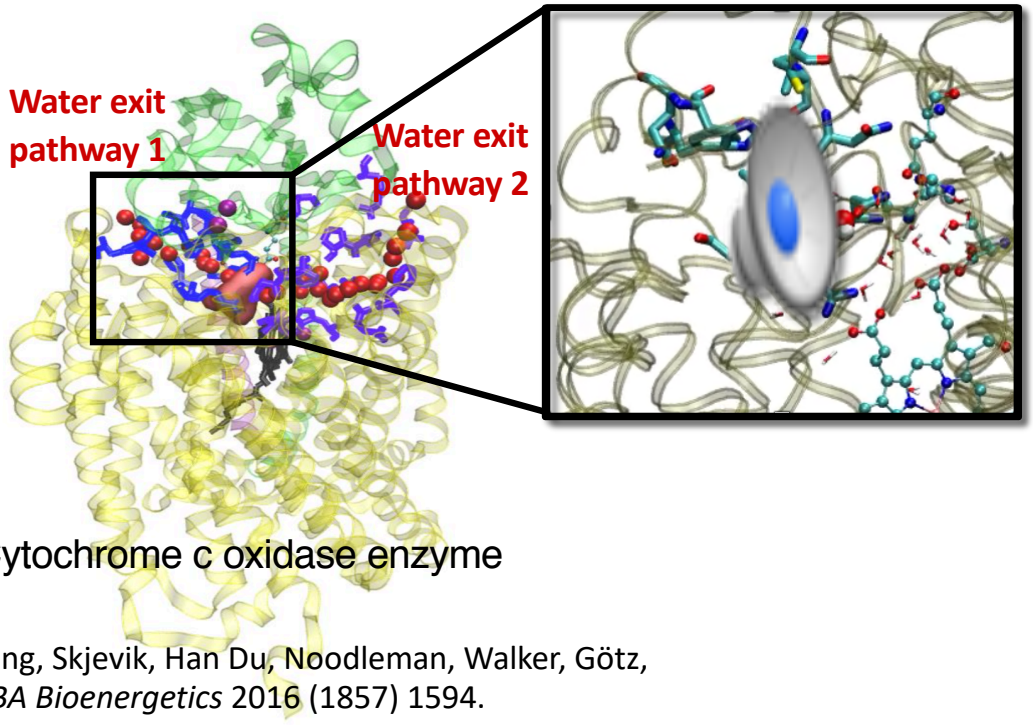
- Octree based partitioning of 3D grid points
- Prescreening of function values on grid point batches leads to linear scaling for large molecules
- Grid point batches are processed in parallel on CPU cores via MPI or GPUs via CUDA.



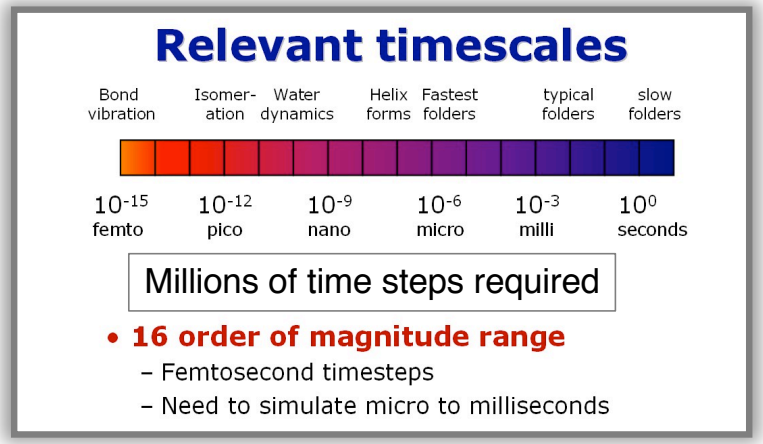
Benchmark examples

Molecular dynamics

- Amber code: Atomistic simulations of condensed phase biomolecular systems



Cytochrome c oxidase enzyme

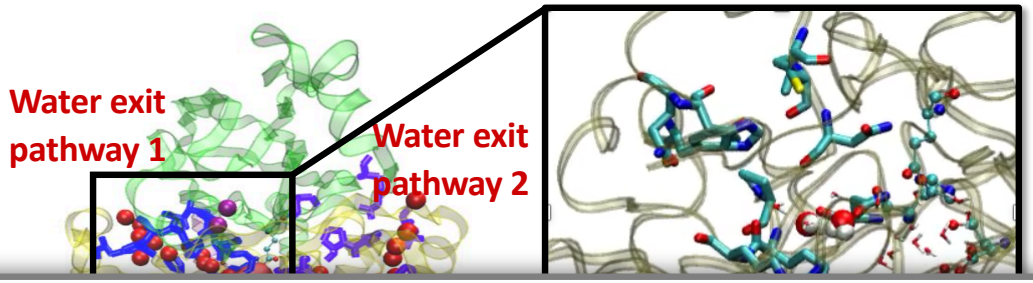


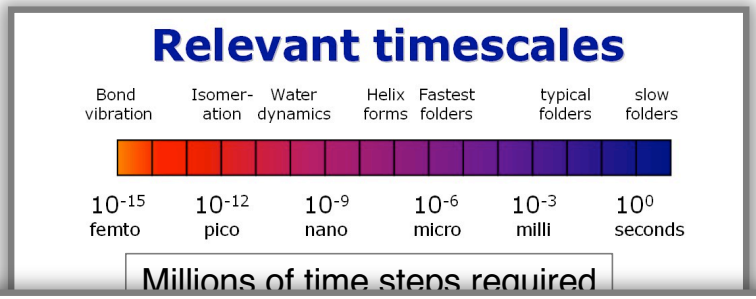
Yang, Skjevik, Han Du, Noodleman, Walker, Götz,
BBA Bioenergetics 2016 (1857) 1594.

Benchmark examples

Molecular dynamics

- Amber code: Atomistic simulations of condensed phase biomolecular systems





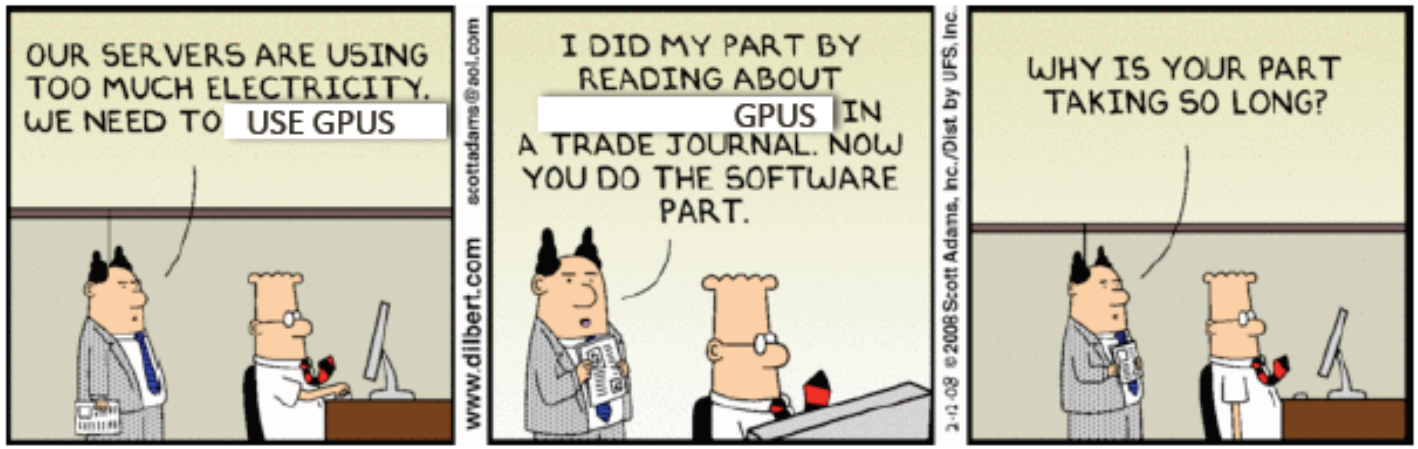
Amber 18 molecular dynamics software

Götz, Williamson, Xu, Poole, Le Grand, Walker, *J Chem Theory Comput* 2012 (8) 1542.

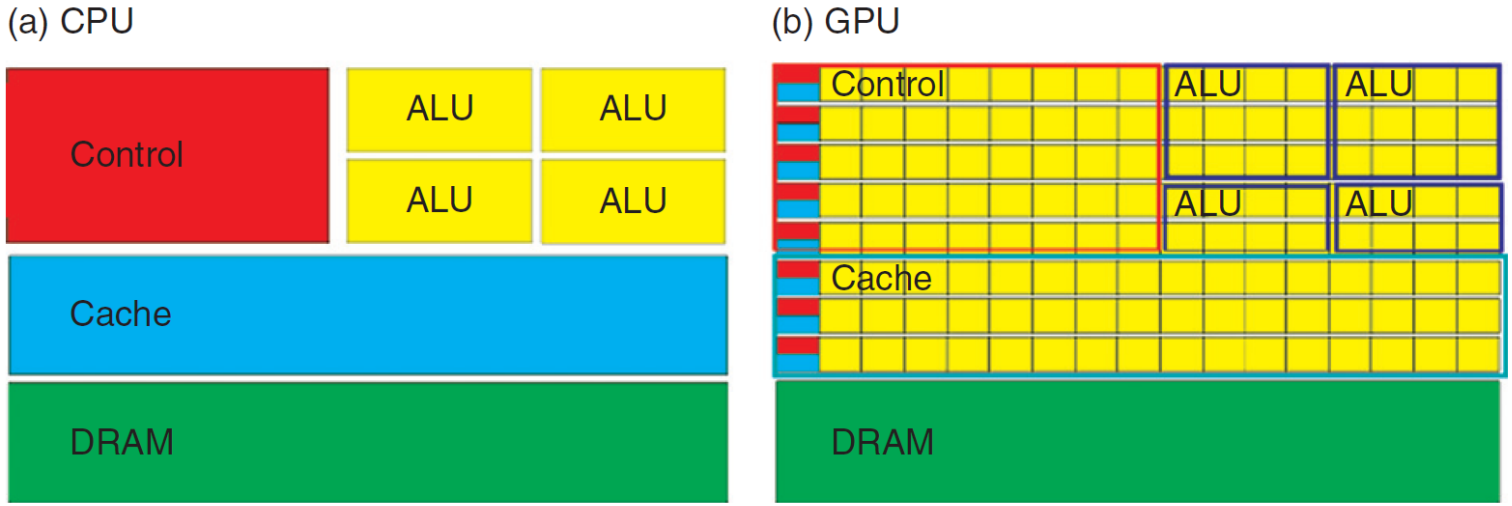
Le Grand, Götz, Walker, *Comput Phys Comm* 2013 (184) 374.

Salomon-Ferrer, Götz, Poole, Le Grand, Walker, *J Chem Theory Comput* 2012 (8) 1542.

What's the catch?



GPU vs CPU architecture



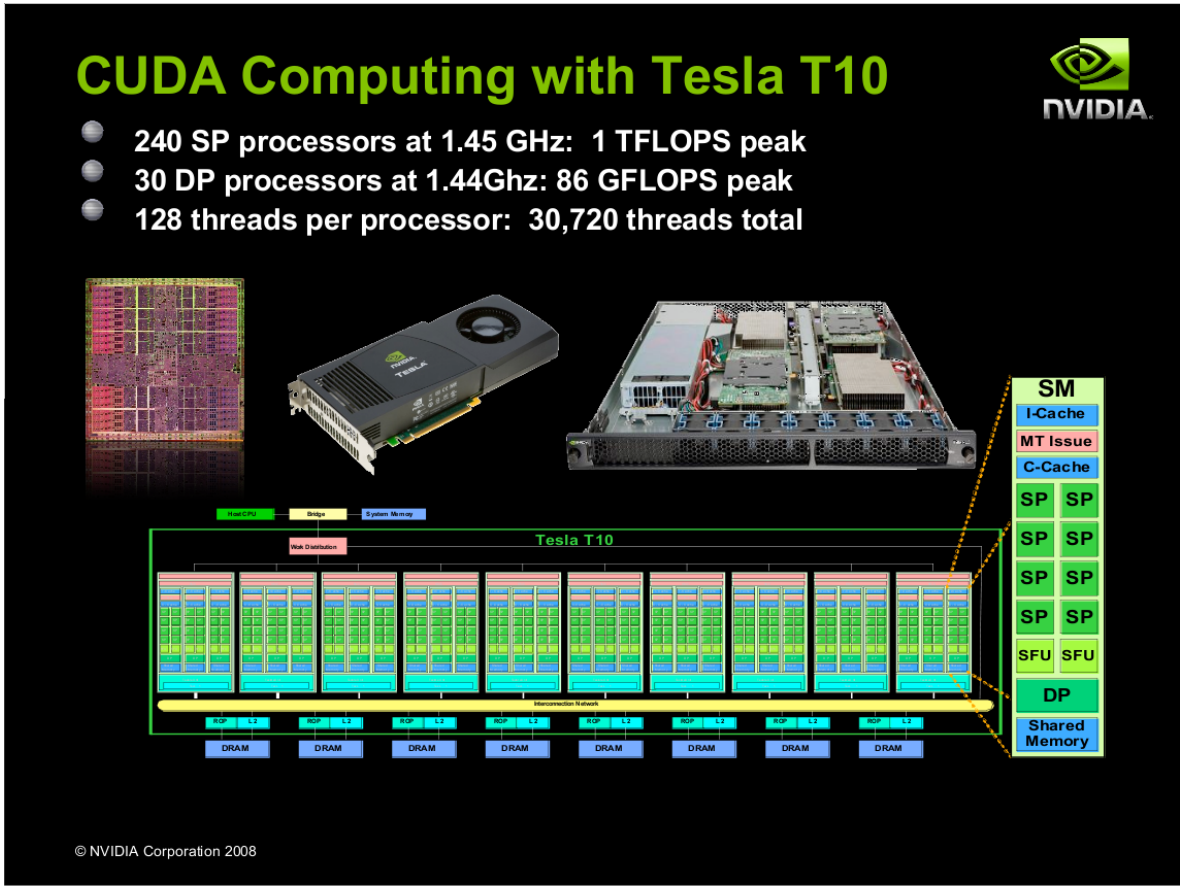
CPU

- Few processing cores with sophisticated hardware
- Multi-level caching
- Prefetching
- Branch prediction

GPU

- Thousands of simplistic compute cores (packaged into a few multiprocessors)
- Operate in lock-step
- Vectorized loads/stores to memory
- Need to manage memory hierarchy

GPU architecture



Nvidia GPU architecture in 2009

- Tesla T10, a server with early C1060 datacenter GPU
- Basic architecture is still the same

Multiprocessor

- SP compute cores
- DP compute core(s)
- Special function units
- Instruction cache
- Shared memory / data cache
- Handles many more threads than processing cores

A brief history of GPU computing

- **2003 - First attempts to use GPUs for general computing.**
  - Programmed as graphics primitives (heroic)
  - problems had to be expressed in terms of vertex coordinates, textures and shader programs.
  - Hardware lacking certain ‘features’ – No random reads or writes etc.
- **2004 – ‘Brook’ programming language for GPUs.**
- **2007 – NVIDIA announce CUDA at SC07**
  - Release GPUs with specific ‘computational’ features.
- **2008 – OpenCL language ratified.**
  - Mainly aimed at embedded devices but has features for GPU computation.
- **2010 – CUDA Fortran language defined.**
- **2011 – OpenACC compiler directive language ratified.**
  - Provides OpenMP like directives for use with GPUs.

GPU programming ‘languages’

Brook

- First widely adopted programming model for general purpose GPU (GPGPU) programming
- Extends C with data-parallel constructs
- Concepts such as streams, kernels, reduction operators
- Easier to write AND faster than hand-tuned GPU code

CUDA – based on ideas of Brook

- Solution to run C seamlessly on GPUs (Proprietary, NVIDIA GPUs only)
- CUDA Toolkit contains compiler, math libraries, debugging and profiling tools
- Lots of code samples, programming guides and other documentation available
- De facto standard for high-performance code

OpenCL

- Industry standard, works for Nvidia and AMD GPUs (and other devices)

GPU programming ‘languages’

CUDA Fortran

- Supports CUDA extensions for Fortran.
- Implemented in Portland Group Compilers.

OpenACC

- OpenMP-like compiler directives language for C/C++ and Fortran.
- Designed to make porting to GPUs easy and quick.
- Full support by PGI Compilers and Cray compilers on Crays
- Partial support by GNU compilers (experimental since version 5.1)
- Also some less commonly used and experimental compilers

OpenMP

- Version 4.x includes accelerator and vectorization directives
- Works well with Intel Xeon Phi (and AVX512), not mature for GPUs, will not discuss here

Common GPU programming

- GPU Kernels – executed on GPU but controlled from host CPU.
- Memory can be copied to and from CPU and GPU memory (synchronization is important)

```
__global__ void kernel( int *a, int dimx, int dimy )
{
    int ix   = blockIdx.x*blockDim.x + threadIdx.x;
    int iy   = blockIdx.y*blockDim.y + threadIdx.y;
    int idx = iy*dimx + ix;

    a[idx]  = a[idx]+1;
}
```

```
__global__ void kernel( int *a, int dimx, int dimy )
{
    int ix   = blockIdx.x*blockDim.x + threadIdx.x;
    int iy   = blockIdx.y*blockDim.y + threadIdx.y;
    int idx = iy*dimx + ix;

    a[idx]  = a[idx]+1;
}
```

CUDA kernel

C program, calls CUDA kernel

```
int main()
{
    int dimx = 16;
    int dimy = 16;
    int num_bytes = dimx*dimy*sizeof(int);

    int *d_a=0, *h_a=0; // device and host pointers

    h_a = (int*)malloc(num_bytes);
    cudaMalloc( (void**)&d_a, num_bytes );

    if( 0==h_a || 0==d_a )
    {
        printf("couldn't allocate memory\n");
        return 1;
    }
```

```
    cudaMemset( d_a, 0, num_bytes );

    dim3 grid, block;
    block.x = 4;
    block.y = 4;
    grid.x  = dimx / block.x;
    grid.y  = dimy / block.y;

    kernel<<<grid, block>>>( d_a, dimx, dimy );

    cudaMemcpy( h_a, d_a, num_bytes, cudaMemcpyDeviceToHost );

    for(int row=0; row<dimy; row++)
    {
        for(int col=0; col<dimx; col++)
            printf("%d ", h_a[row*dimx+col] );
        printf("\n");
    }

    free( h_a );
    cudaFree( d_a );

    return 0;
}
```

Hardware complexities

Hardware characteristics change across GPU models and generations

- Single precision / double precision floating point performance
- Memory bandwidth
- Number of compute cores and multiprocessors
- Number of threads that the hardware can execute
- Number of registers and cache size
- Available GPU memory, device / shared

Memory hierarchy needs to be explicitly managed

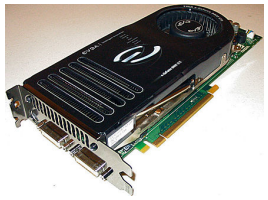
- CPU memory, GPU global / shared / texture / constant memory
- Unified memory helps, but the memory hierarchy still exists

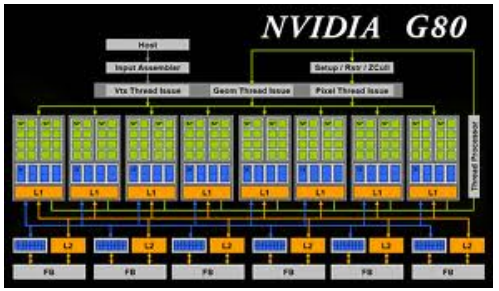
Different hardware vendors work in different ways

- Nvidia vs AMD

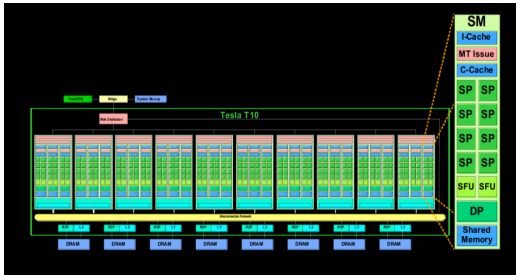
Hardware complexities

C870 – Nov 2006
- First 'programmable' Card
- Single Precision Only
- 1.5GB RAM

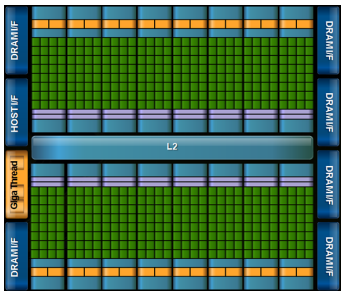




C1060 – Jun 2008
- DP / SP = 1 / 8
- 4GB RAM



C2050 – Nov 2010
- DP / SP = 1 / 2
- 3GB RAM



Hardware complexities

K10 – Jun 2012
- DP / SP = 1 / 24
- 2 GPUs on 1 board
- 4GB RAM per GPU

K20 – Nov 2012
- DP / SP = 1 / 3
- 5GB RAM

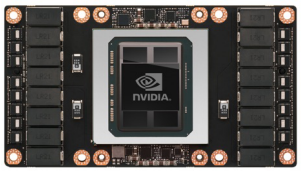
K80 – Nov 2014
- DP / SP = 1 / 3
- 2 GPUs per board
- 2 x 12GB RAM

K40 – Nov 2013
- DP / SP = 1 / 3
- 12GB RAM

Hardware complexities

M40 – Nov 2015
- DP / SP = 1 / 3
- 12 or 24GB RAM

P100 – Q2 2016
- DP / SP = 1 / 2
- 16GB RAM



V100 – Q2 2017
- DP / SP = 1 / 2
- 16 or 32GB RAM

	C2050	K10	K20	K40	K80	M40	P100	V100
#Multi Proc	14	8 (x2)	13	15	**13** (x2)	24	**56**	80
SP Cores per MP	32	192	192	192	**192**	128	**64**	64
#Cores	448	1,536 (x2)	2,496	2,880	2,496 (x2)	3,072	3,584	5,120
Warp Size	32	32	32	32	32	32	32	32
DP Gflop/s	515	95 (x2)	1,170	1,680	1,455 (x2)	213	4,763	7,066

Nvidia GPU models

Nvidia compute capabilities determine features available on Nvidia GPUs

- E.g. double precision support since version 1.3

Hardware Version 3.0 / 3.5 (Kepler I / Kepler II)
- Tesla K20 / K20X / K40 /K80
- Tesla K10 / K8
- GTX-Titan / Titan-Black / Titan-Z
- GTX770 / 780 / 780Ti
- GTX670 / 680 / 690
- Quadro cards supporting SM3.0 or 3.5

Hardware Version 5.0 / 5.5 (Maxwell)
- M4, M40, M60
- GTX-Titan-X
- GTX970 / 980 / 980 Ti
- Quadro cards supporting SM5.0 or 5.5

Hardware Version 6.0 (Pascal P100/DGX-1)
- Quadro GP100 (with optional NVLink)
- P100 12GB / P100 16GB / DGX-1

Hardware Version 6.1 (Pascal GP102/104)
- Titan-XP [aka Pascal Titan-X]
- GTX-1080TI / 1080 / 1070 / 1060
- Quadro P6000 / P5000
- P4 / P40

Hardware Version 7.0 (Volta V100)
- Titan-V
- V100

Hardware Version 7.5 (Turing TU102, …)
- GeForce RTX 2080 etc
- Quadro RTX 8000 etc
- Tesla T4 (useful for ML inference)

Hardware version 8.0 (Ampere, GA100)
- Tesla A100

What this means for your program

Threads

- Never write code with any assumption for how many threads it will use.
- Use functions (CUDA calls) to query the hardware configuration at runtime.
- Launch many more threads than processing cores.

Data types

- Avoid using double precision where not specifically needed.

GPU programming languages

OpenCL

- Industry standard, works for Nvidia and AMD GPUs (and other devices)

CUDA

- Proprietary, works only for Nvidia GPUs
- De-facto standard for high-performance code

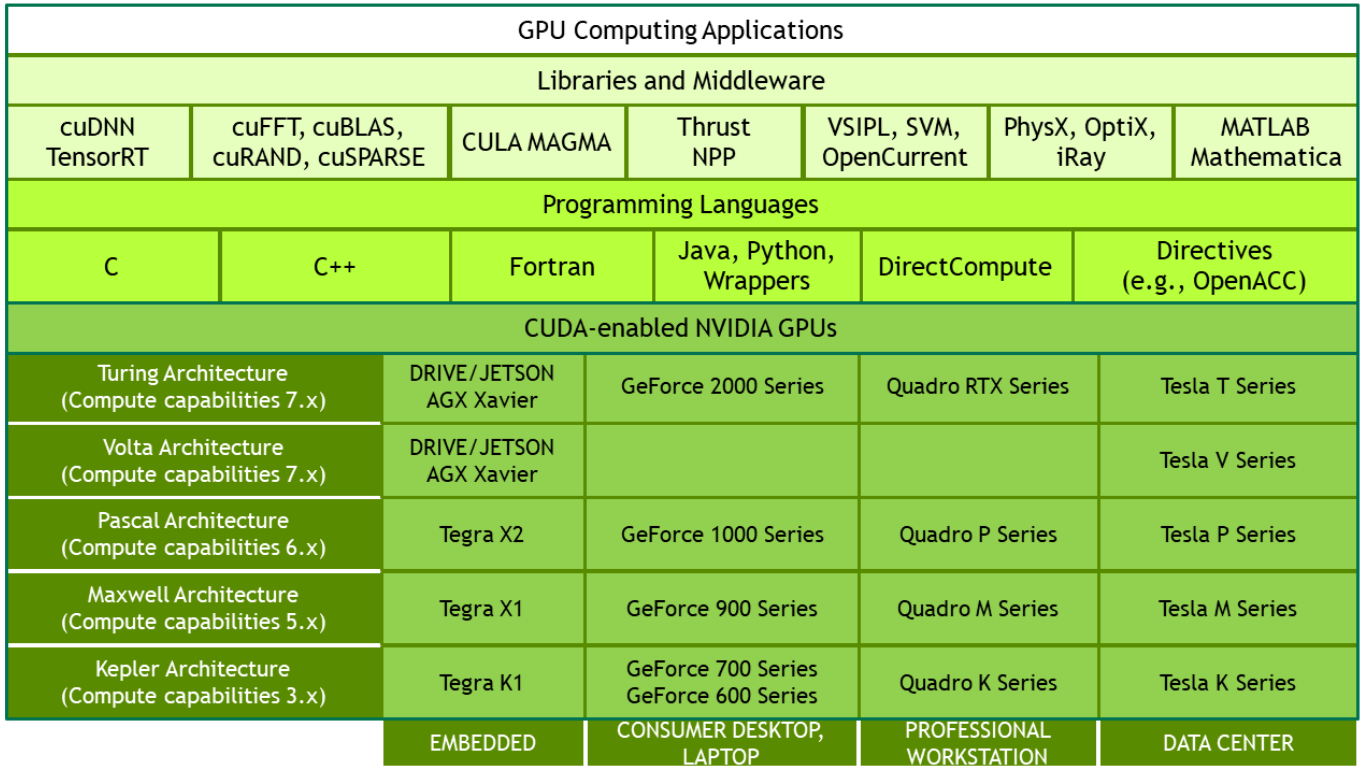
OpenACC

- Accelerator directives for Nvidia and AMD
- Works with C/C++ and Fortran

OpenMP

- Version 4.x includes accelerator and vectorization directives
- Works well with Intel Xeon Phi (and AVX512), not mature for GPUs

Nvidia GPU computing universe



Source: CUDA C programming guide
https://docs.nvidia.com/cuda/cuda-c-programming-guide/index.html

Nvidia CUDA Toolkit

Obtain from https://nvidia.com/getcuda

Compiler

- CUDA compiler (nvcc)

Development Tools

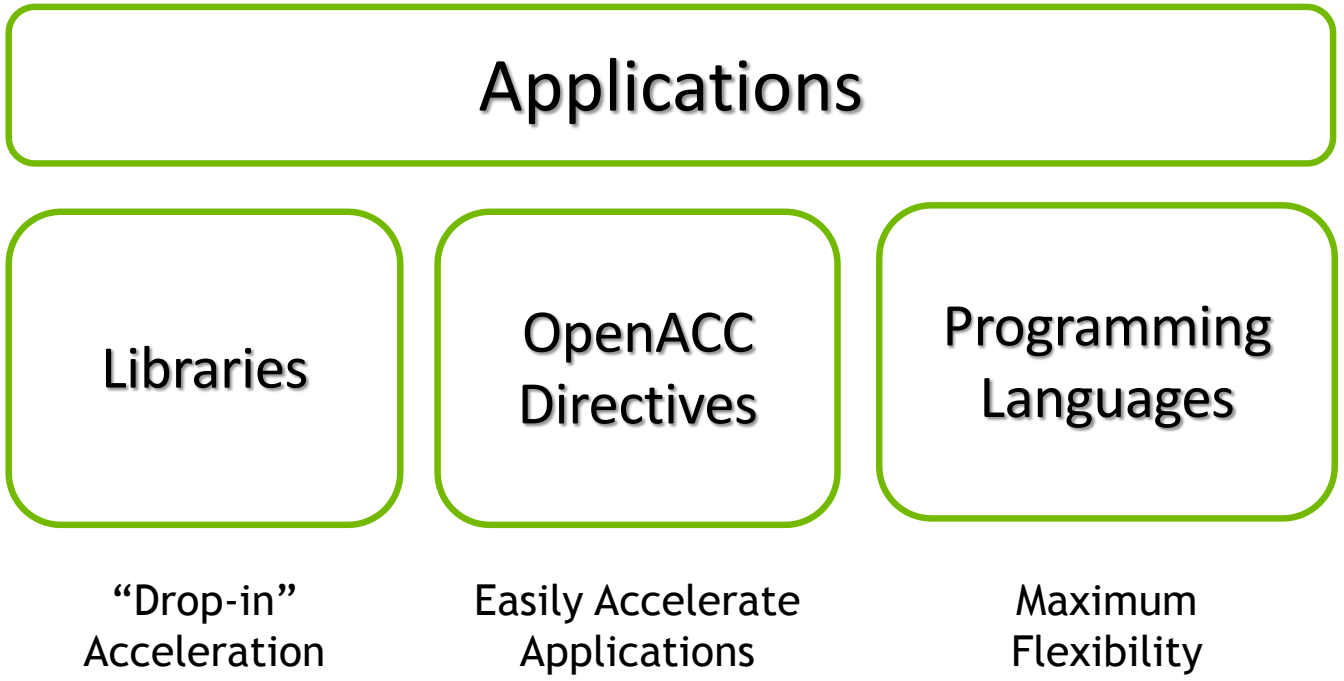
- Debugger (CUDA-gdbm CUDA-memcheck)
- Profiler (nvprof, nvvp)
- Nsight IDE for Eclipse and Visual Studio

Libraries

- cuBLAS, cuFFT, cuRAND, cuSPARSE, cuSolver, NPP, cuDNN, Thrust, CUDA Math Library, cuDNN

CUDA code samples

3 ways to use GPUs



Using GPU accelerated libraries

GPU accelerated libraries

Ease of use

- GPU acceleration without in-depth knowledge of GPU programming

“Drop-in”

- Many GPU accelerated libraries follow standard APIs
- Minimal code changes required

Quality

- High-quality implementations of functions encountered in a broad range of applications

Performance

- Libraries are tuned by experts

=> Use if you can – (do not write your own matrix multiplication)

GPU accelerated libraries

See https://developer.nvidia.com/gpu-accelerated-libraries

Deep Learning Libraries

GPU-accelerated library of primitives for deep neural networks

GPU-accelerated neural network inference library for building deep learning applications

Advanced GPU-accelerated video inference library

Signal, Image and Video Libraries

cuFFT

GPU-accelerated library for Fast Fourier Transforms

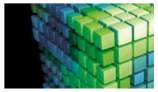
NVIDIA Performance Primitives

GPU-accelerated library for image and signal processing

NVIDIA Codec SDK

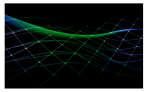
High-performance APIs and tools for hardware accelerated video encode and decode

Linear Algebra and Math Libraries



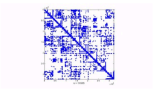
cuBLAS

GPU-accelerated standard BLAS library



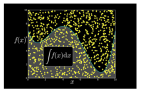
CUDA Math Library

GPU-accelerated standard mathematical function library



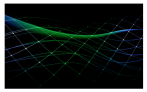
cuSPARSE

GPU-accelerated BLAS for sparse matrices



cuRAND

GPU-accelerated random number generation (RNG)



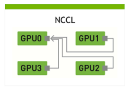
cuSOLVER

Dense and sparse direct solvers for Computer Vision, CFD, Computational Chemistry, and Linear Optimization applications

AmgX

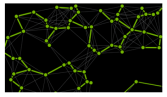
GPU accelerated linear solvers for simulations and implicit unstructured methods

Parallel Algorithm Libraries



NCCL

Collective Communications Library for scaling apps across multiple GPUs and nodes



nvGRAPH

GPU-accelerated library for graph analytics

Thrust

GPU-accelerated library of parallel algorithms and data structures

Partner Libraries

… and several others

GPU accelerated libraries

3 steps to using libraries

- Step 1: Substitute library calls with equivalent CUDA library calls

  `saxpy ( … )` ⟹ `cublasSaxpy ( … )`

- Step 2: Manage data locality

  - with CUDA: `cudaMalloc(), cudaMemcpy(), etc.`
  - with CUBLAS: `cublasSetVector(), cublasGetVector()` `etc.`

- Step 3: Rebuild and link the CUDA-accelerated library

```
nvcc myobj.o –l cublas
```

CUBLAS library example

```
int N = 1 << 20;
```

```
// Perform SAXPY on 1M elements: y[]=a*x[]+y[]
saxpy(N, 2.0, d_x, 1, d_y, 1);
```

CUBLAS library example

```
int N = 1 << 20;
```

```
// Perform SAXPY on 1M elements: d_y[]=a*d_x[]+d_y[]
cublasSaxpy(handle, N, 2.0, d_x, 1, d_y, 1);
```

Add “cublas” prefix and use device variables

CUBLAS library example

```
int N = 1 << 20;
cublasCreate(&handle);
```

Initialize CUBLAS

```
// Perform SAXPY on 1M elements: d_y[]=a*d_x[]+d_y[]
cublasSaxpy(handle, N, 2.0, d_x, 1, d_y, 1);
```

```
cublasDestroy(handle);
```

Shut down CUBLAS

CUBLAS library example

```
int N = 1 << 20;
cublasCreate(&handle);
cudaMalloc((void**)&d_x, N*sizeof(float));
cudaMalloc((void**)&d_y, N*sizeof(float));
```

Allocate device vectors

```
// Perform SAXPY on 1M elements: d_y[]=a*d_x[]+d_y[]
cublasSaxpy(handle, N, 2.0, d_x, 1, d_y, 1);
```

```
cudaFree(d_x);
cudaFree(d_y);
cublasDestroy(handle);
```

Deallocate device vectors

CUBLAS library example

```
int N = 1 << 20;
cublasCreate(&handle);
cudaMalloc((void**)&d_x, N*sizeof(float));
cudaMalloc((void**)&d_y, N*sizeof(float));

cublasSetVector(N, sizeof(x[0]), x, 1, d_x, 1);
cublasSetVector(N, sizeof(y[0]), y, 1, d_y, 1);

// Perform SAXPY on 1M elements: d_y[]=a*d_x[]+d_y[]
cublasSaxpy(N, 2.0, d_x, 1, d_y, 1);

cublasGetVector(N, sizeof(y[0]), d_y, 1, y, 1);

cublasFree(d_x);
cublasFree(d_y);
cublasDestroy(handle);
```

Transfer data to GPU

Read data back from GPU

CUBLAS library example

```
int N = 1 << 20;
cublasCreate(&handle);
cudaMalloc((void**)&d_x, N*sizeof(float));
cudaMalloc((void**)&d_y, N*sizeof(float));

cublasSetVector(N, sizeof(x[0]), x, 1, d_x, 1);
cublasSetVector(N, sizeof(y[0]), y, 1, d_y, 1);

// Perform SAXPY on 1M elements: d_y[]=a*d_x[]+d_y[]
cublasSaxpy(N, 2.0, d_x, 1, d_y, 1);

cublasGetVector(N, sizeof(y[0]), d_y, 1, y, 1);

cublasFree(d_x);
cublasFree(d_y);
cublasDestroy(handle);
```

CUDA C Basics

Nvidia CUDA

See https://developer.nvidia.com/cuda-zone

CUDA C

- Solution to run C seamlessly on GPUs (Nvidia only)
- De-facto standard for high-performance code on Nvidia GPUs
- Nvidia proprietary
- Modest extensions but major rewriting of code

CUDA Toolkit (free)

- Contains CUDA C compiler, math libraries, debugging and profiling tools

CUDA Fortran

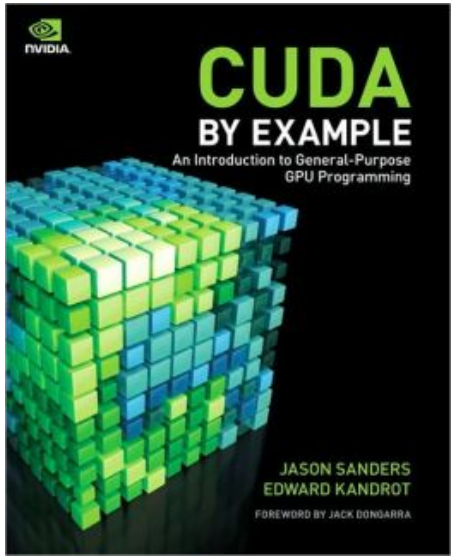
- Supports CUDA extensions in Fortran, developed by Portland Group Inc (PGI)
- Available in the PGI Fortran Compiler
- PGI is now part of Nvidia

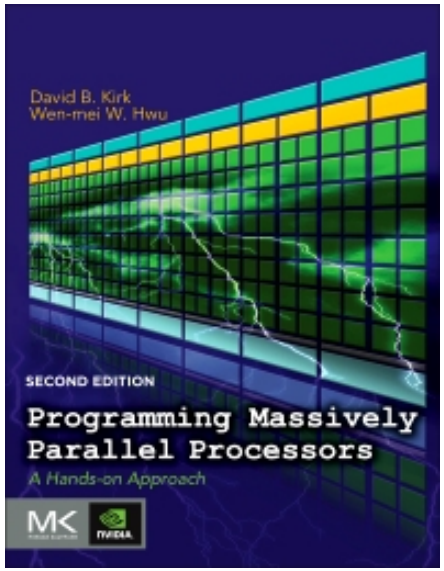
Nvidia CUDA C basics

CUDA programming guide

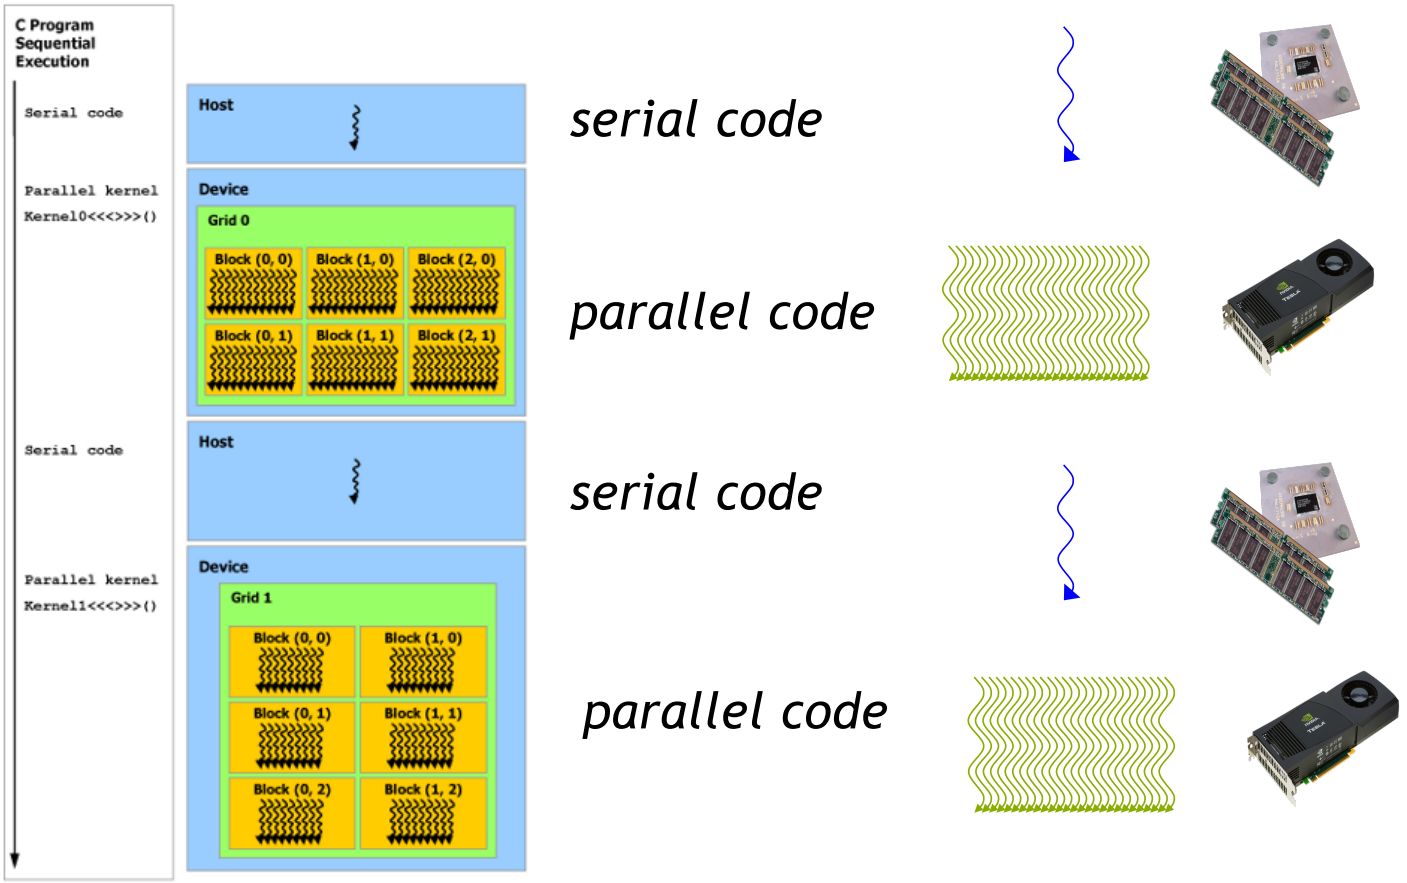
- See http://docs.nvidia.com/cuda/cuda-c-programming-guide/

Good books to get started

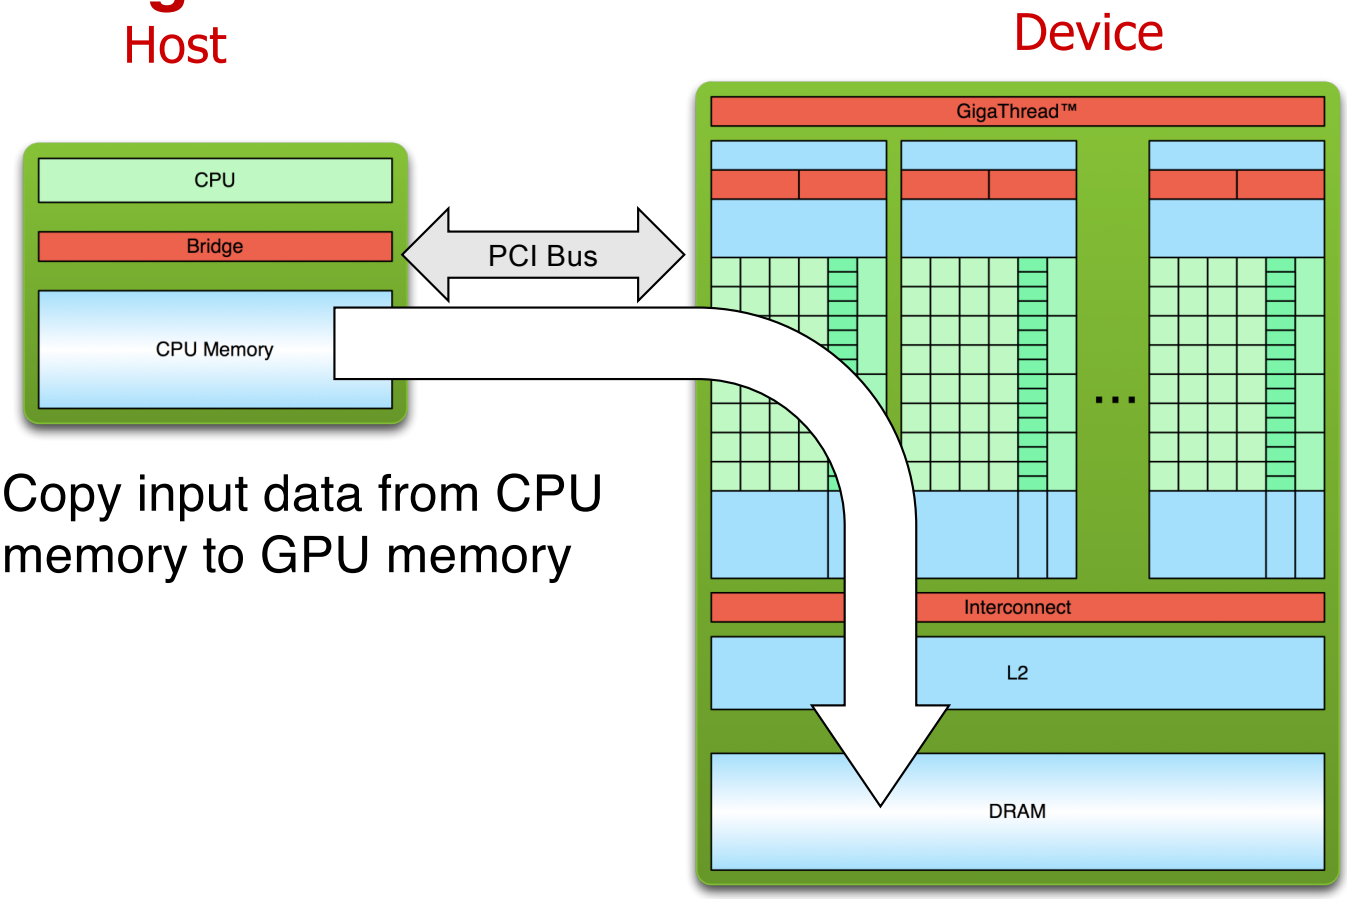




Heterogeneous Computing

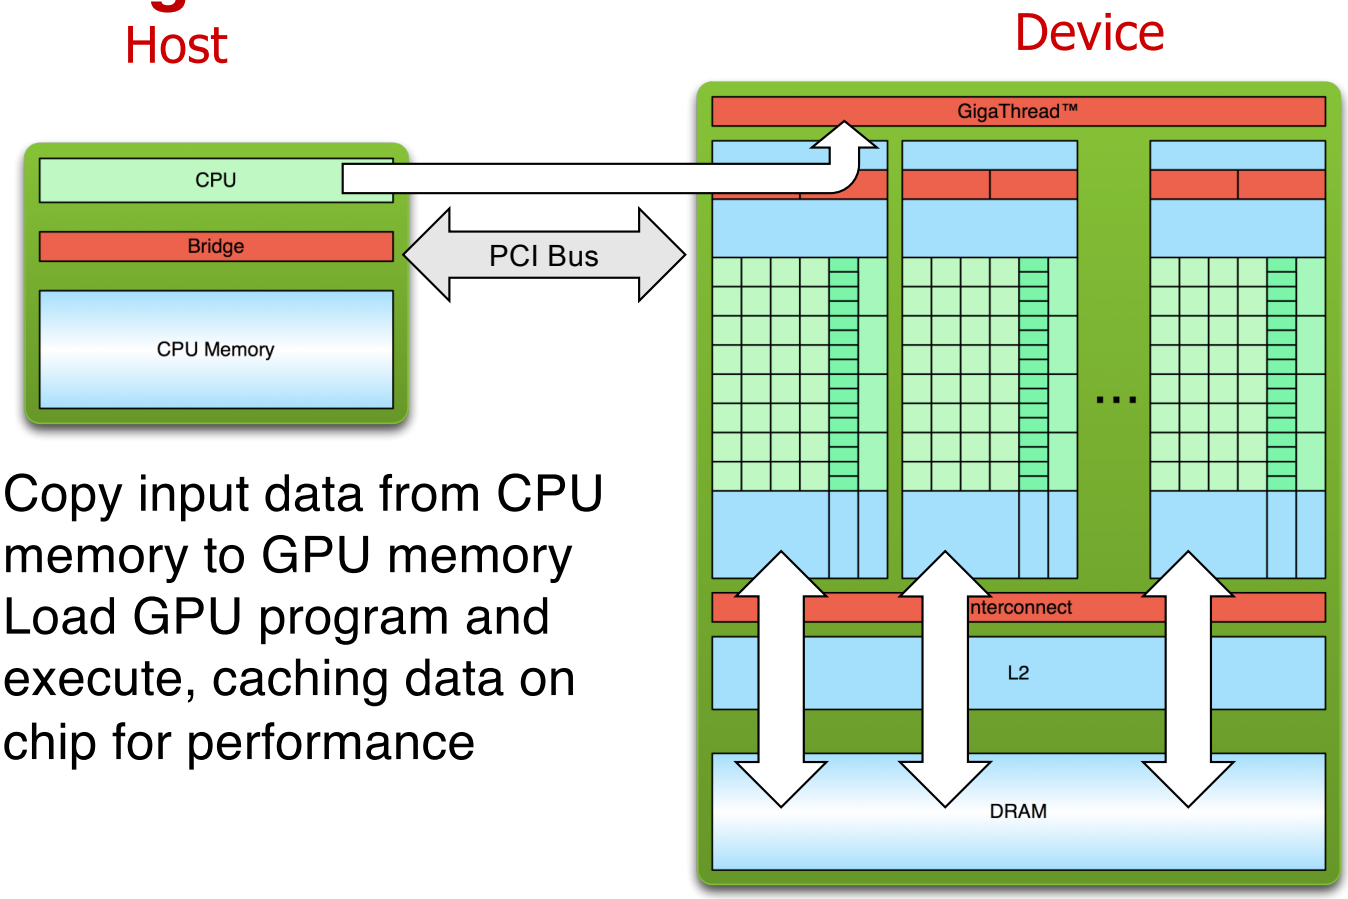


Processing Flow



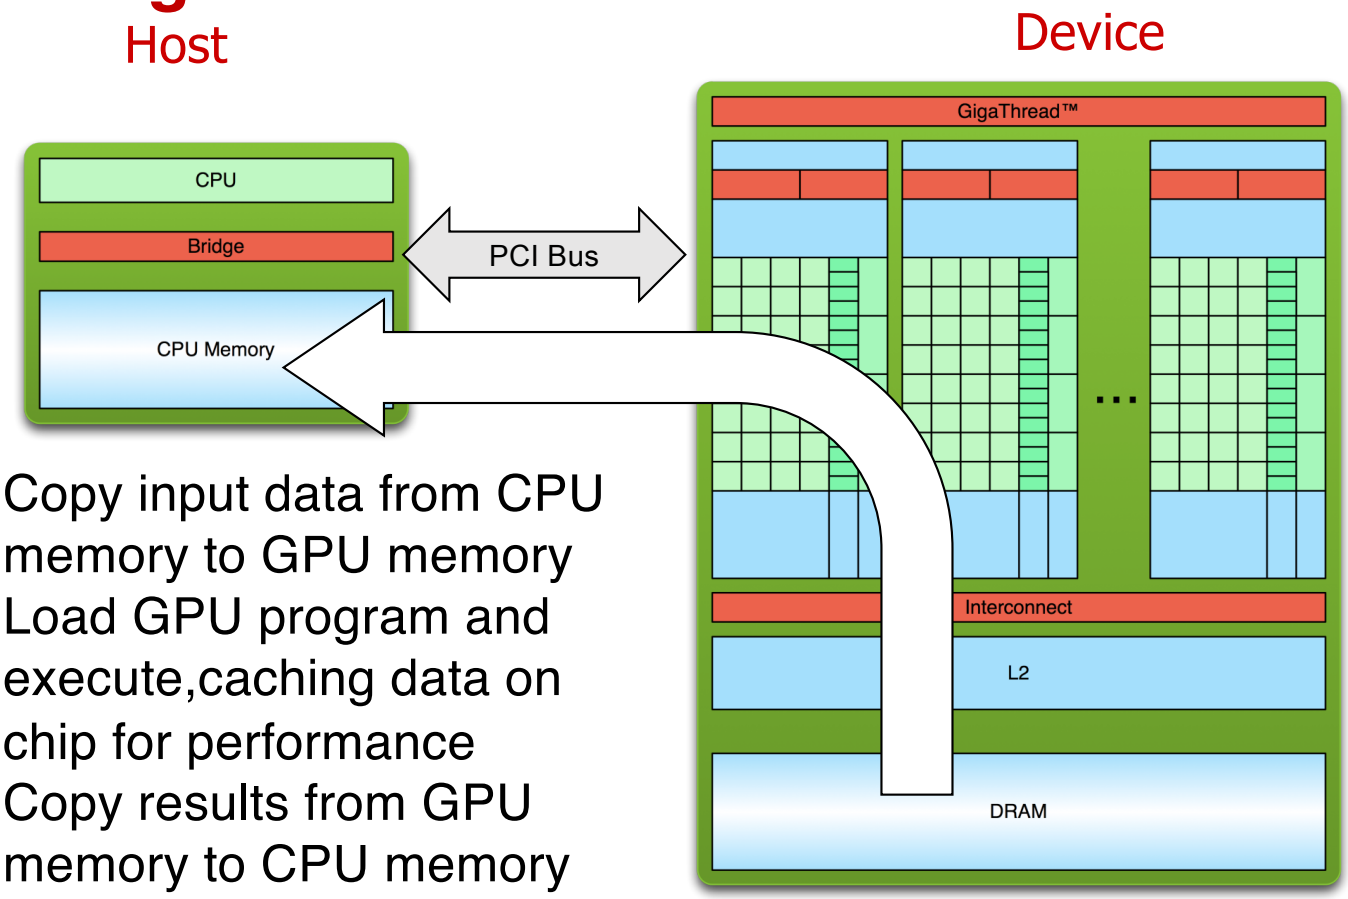
1. Copy input data from CPU memory to GPU memory

Processing Flow



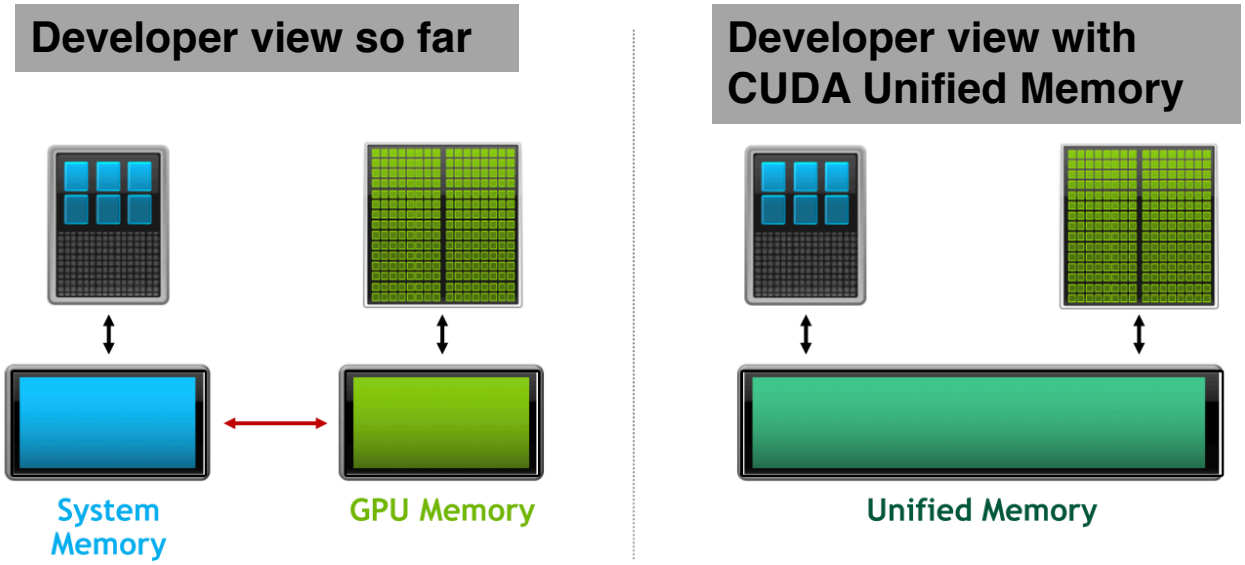
1. Copy input data from CPU memory to GPU memory
2. Load GPU program and execute, caching data on chip for performance

Processing Flow



1. Copy input data from CPU memory to GPU memory
2. Load GPU program and execute,caching data on chip for performance
3. Copy results from GPU memory to CPU memory

Unified memory



- Pool of managed memory that is shared between host and device
- Primarily productivity feature
- Memory copies still happen under the hood
- Available since CUDA 6 on Kepler architecture
- Page fault mechanisms supported since Pascal architecture

Some CUDA basics

Kernel

- In CUDA, a kernel is code (typically a function), that can be executed on the GPU.
- The kernel code operates in lock-step on the multiprocessors of the GPU.
  (In so-called warps, currently consisting of 32 threads)

Thread

- A thread is an execution of a kernel with a given index.
- Each thread uses its index to access a subset of data (e.g. array) to operate on.

Block

- Threads are grouped into blocks, which are guaranteed to execute on the same multiprocessor.
- Threads within a thread block can synchronize and share data

Grid

- Thread blocks are arranged into a grid of blocks.
- The number of threads per block times the number of blocks gives the total number of running threads.

Some CUDA basics

Threads, blocks, grids, warps

Grids

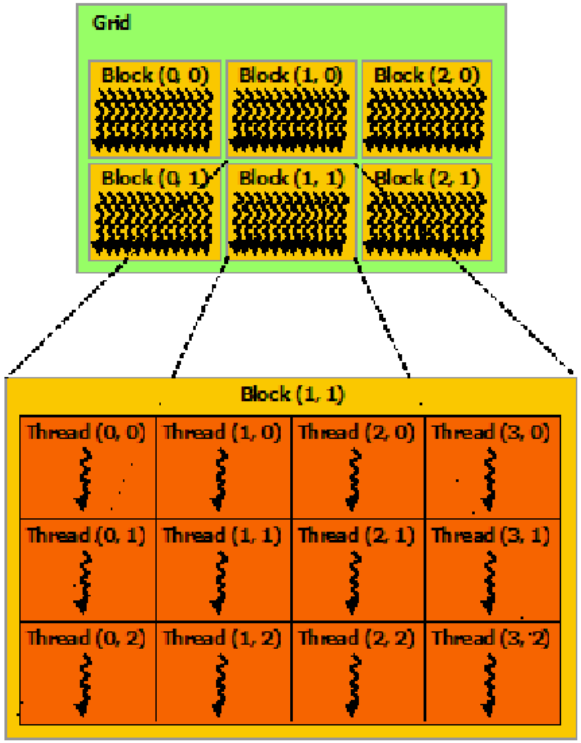
- Grids map to GPUs

Blocks

- Blocks map to the multiprocessors (MP)
- Blocks are never split across MPs
- Multiple blocks can execute simultaneously on an MP

Threads

- Threads are executed on stream processors (GPU cores)
- Warps are groups of threads that execute simultaneously, in lock-step (currently 32, not guaranteed to remain fixed).



Some CUDA basics

CUDA built-in variables

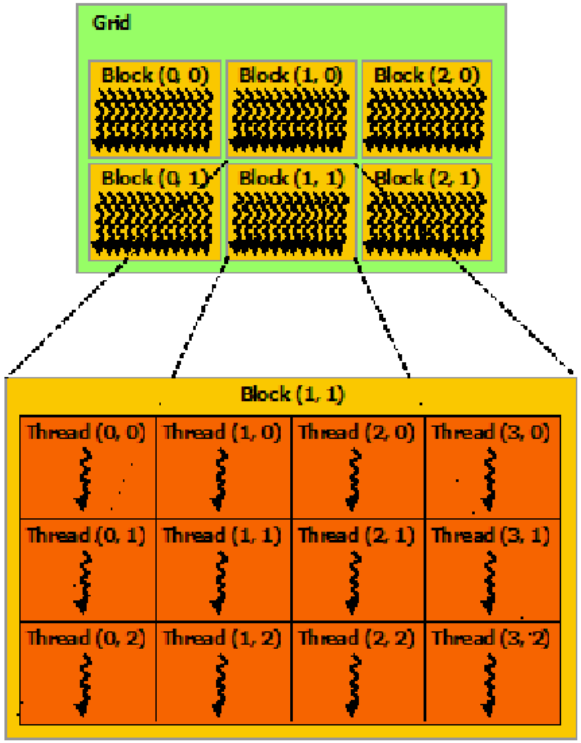
- Following variables allow to compute the ID of each individual thread that is executing in a grid block.

Block indexes

- `gridDim.x, gridDim.y, gridDim.z (unused)`
- `blockIdx.x, blockIdx.y, blockIdx.z`
- Variables that return the grid dimension (number of blocks) and block ID in the x-, y-, and z-axis.

Thread indexes

- `blockDim.x, blockDim.y, blockDim.z`
- `threadIdx.x, threadIdx,y, threadIdx.z`
- Variables that return the block dimension (number of threads per block) and thread ID in the x-, y-, and z-axis.



Example in the figure is executing 72 threads

- (3 x 2) blocks = 6 blocks
- (4 x 3) threads per block = 12 threads per block

Some CUDA basics

__global__ keyword

- Function that executes on the device (GPU), must return `void`, and is called from host code.

```
__global__ vector_add_kernel(int *a, int *b, int *c, int n){
     int tid = threadIdx.x + blockDim.x * blockIdx.x;
     int stride = blockDim.x * gridDim.x;
     while (tid < n) {
            c[tid] = a[tid] + b[tid];
            tid += stride;
     }
 }
```

CUDA API handles device memory

- `cudaMalloc(), cudaFree(), cudaMemcpy()`
- Equivalent to C `malloc(), free(), memcpy()`
- `cudaMemcpy()` is used to transfer data between CPU and GPU memory.

CUDA kernel launch specification

- Triple angle bracket determines grid and block size (i.e. total number of threads) for kernel launch:

```
vector_add_kernel<<<dim3(bx,by,bz), dim3(tx,ty,tz)>>>(d_a, d_b, d_c, N);
```

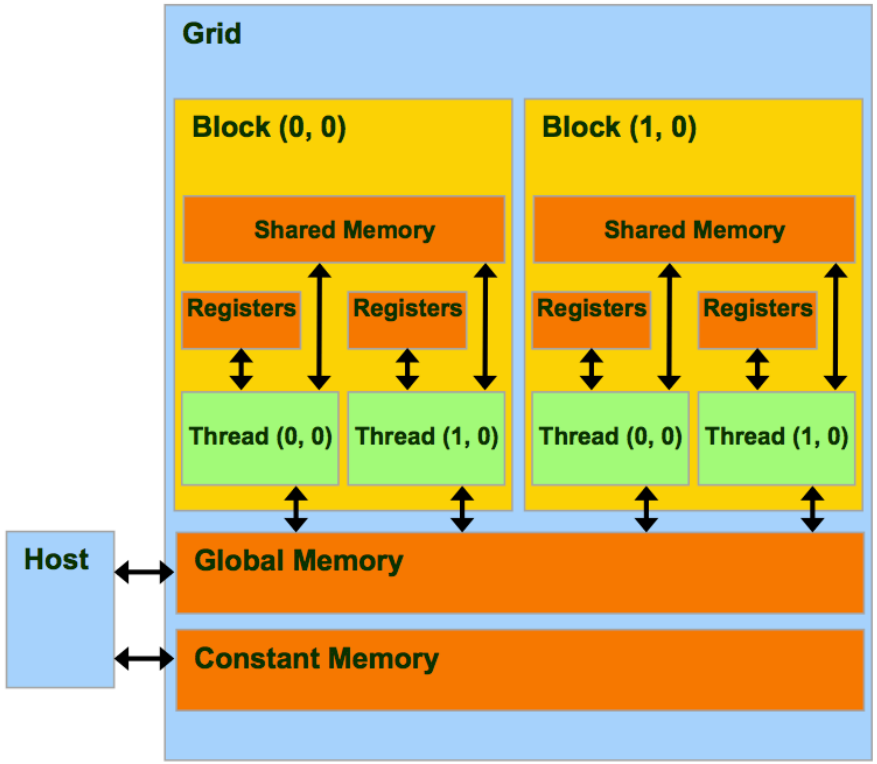
Some CUDA basics

CUDA memory hierarchy

- Host memory (x86 server)
- Device memory (GPU)

Device memory

- Global memory
  visible to all threads, slow
- Shared memory
  visible to all threads in a block, fast on-chip
- Registers
  per-thread memory, fast on-chip
- Local memory
  per-thread, slow, stored in Global Memory space
- Constant memory
  visible to all threads, read only, off-chip, cached
  broadcast to all threads in a half-warp (16 threads)



General CUDA programming strategy

Avoid data transfers between CPU and GPU

- These are slow due to low PCI express bus bandwidth

Minimize access to global memory

- Hide memory access latency by launching many threads

Take advantage of fast shared memory by tiling data

- Partition data into subsets that fit into shared memory
- Handle each data subset with one thread block
- Load the subset from global to shared memory using multiple threads to exploit parallelism in memory access
- Perform computation on data subset in shared memory (each thread in thread block can access data multiple times)
- Copy results from shared memory to global memory

CUDA Example: Matrix-matrix multiply

```
float* host_A, host_B, host_C;
float* device_A, device_B, device_C;

// Allocate host memory
host_A = (float*) malloc(mem_size_A);
host_B = (float*) malloc(mem_size_B);
host_C = (float*) malloc(mem_size_C);

// Allocate device memory
cudaMalloc((void**) &device_A, mem_size_A);
cudaMalloc((void**) &device_B, mem_size_B);
cudamalloc((void**) &device_C, mem_size_C);

// Set up the initial values of A and B here.
...
```

CUDA Example: Matrix-matrix multiply - 2

```
// copy host memory to device
cudaMemcpy(device_A, host_A, mem_size_A, cudaMemcpyHostToDevice);
cudaMemcpy(device_B, host_B, mem_size_B, cudaMemcpyHostToDevice);

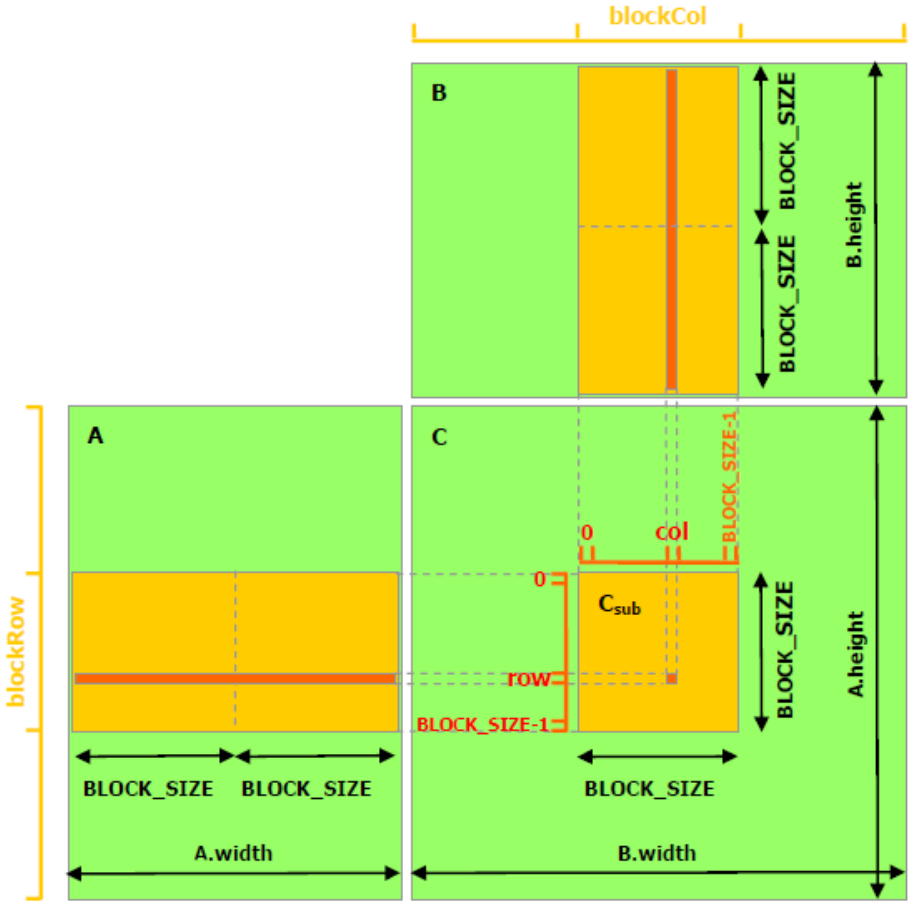
// setup execution parameters
dim3 threads(BLOCK_SIZE, BLOCK_SIZE);
dim3 grid(WC / threads.x, HC / threads.y);

// execute the kernel
matrixMul<<< grid, threads >>>(device_C, device_A, device_B, WA, WB);

// copy result from device to host
cudaMemcpy(host_C, device_C, mem_size_C, cudaMemcpyDeviceToHost);

// Free host and device memory
...
```

CUDA Example: Matrix-matrix multiply kernel



CUDA Example: Matrix-matrix multiply kernel

```
__global__ void matrixMul( float* C, float* A, float* B, int wA, int wB)
{
  // Block index
  int bx = blockIdx.x;
  int by = blockIdx.y;
  // Thread index
  int tx = threadIdx.x;
  int ty = threadIdx.y;
  // Index of the first sub-matrix of A processed by the block
  int aBegin = wA * BLOCK_SIZE * by;
  // Index of the last sub-matrix of A processed by the block
  int aEnd = aBegin + wA - 1;
  // Step size used to iterate through the sub-matrices of A
  int aStep = BLOCK_SIZE;
  // Index of the first sub-matrix of B processed by the block
  int bBegin = BLOCK_SIZE * bx;
  // Step size used to iterate through the sub-matrices of B
  int bStep = BLOCK_SIZE * wB;
  // Csub is used to store the element of the block sub-matrix
  // that is computed by the thread
  float Csub = 0;
```

CUDA Example: Matrix-matrix multiply kernel – 2

```
// Loop over all the sub-matrices of A and B
// required to compute the block sub-matrix
for (int a = aBegin, b = bBegin;
     a <= aEnd;
     a += aStep, b += bStep) {
  // Declaration of the shared memory array As
  // store the sub-matrix of A
  __shared__ float As[BLOCK_SIZE][BLOCK_SIZE];
  // Declaration of the shared memory array Bs
  // store the sub-matrix of B
  __shared__ float Bs[BLOCK_SIZE][BLOCK_SIZE];
  // Load the matrices from device memory
  // to shared memory; each thread loads
  // one element of each matrix
  AS(ty, tx) = A[a + wA * ty + tx];
  BS(ty, tx) = B[b + wB * ty + tx];
  // Synchronize to make sure the matrices are loaded
  __syncthreads();
```

CUDA Example: Matrix-matrix multiply kernel – 3

```
    // Multiply the two matrices together;
    // each thread computes one element of the block sub-matrix
    for (int k = 0; k < BLOCK_SIZE; ++k)
      Csub += AS(ty, k) * BS(k, tx);
    // Synchronize to make sure that the preceding
    // computation is done before loading two new
    // sub-matrices of A and B in the next iteration
    __syncthreads();
  }
  // Write the block sub-matrix to device memory;
  // each thread writes one element
  int c = wB * BLOCK_SIZE * by + BLOCK_SIZE * bx;
  C[c + wB * ty + tx] = Csub;
}
```

CUDA Example: Matrix-matrix multiply summary

Summary

- We made use of a variety of CUDA features including
- 2D grids and blocks
- Shared memory
- Thread synchronization

Note

- In reality we would not write a matrix-matrix multiplication function
- The CUDA implementation of BLAS is highly optimized for GPUs

Directive based GPU programming with OpenACC

Partially based on material by
Mark Harris (Nvidia)

Directive based programming

OpenACC

- See https://www.openacc.org
- Open standard for expressing accelerator parallelism
- Designed to make porting to GPUs easy, quick, and portable
- OpenMP-like compiler directives language
  - If the compiler does not understand the directives, it will ignore them.
  - Same code can work with or without accelerators.
- Fortran and C
- Full support by PGI compilers and Cray compilers on Crays
- Partial support by GNU compilers (experimental since version 5.1)
- Also some less commonly used and experimental compilers

OpenMP

- See https://www.openmp.org
- Not mature for GPUs, will not discuss here

Directive based programming

PGI Community Edition

- See hhttps://developer.nvidia.com/openacc-toolkit
- Community Edition is free
- PGI Accelerator Fortran / C / C++ compilers
- PGI 2018 supports
  - OpenACC 2.6 for Nvidia GPIs
  - OpenACC 2.6, CUDA Fortran, OpenMP 4.5 for Multicore CPUs
- Pgprof performance profiler
- GPU-enabled libraries
- OpenACC code samples

A simple OpenACC exercise: SAXPY

SAXPY in C

```
void saxpy(int n,
           float a,
           float *x,
           float *restrict y)
{
#pragma acc kernels
  for (int i = 0; i < n; ++i)
    y[i] = a*x[i] + y[i];
}

...
// Perform SAXPY on 1M elements
saxpy(1<<20, 2.0, x, y);
...
```

SAXPY in Fortran

```
subroutine saxpy(n, a, x, y)
  real :: x(:), y(:), a
  integer :: n, i
!$acc kernels
  do i=1,n
    y(i) = a*x(i)+y(i)
  enddo
!$acc end kernels
end subroutine saxpy

...
! Perform SAXPY on 1M elements
call saxpy(2**20, 2.0, x_d, y_d)
...
```

OpenACC directives syntax

Fortran

```
!$acc directive [clause [,] clause] …]
```

Often paired with a matching end directive surrounding a structured code block

```
!$acc end directive
```

`kernels` construct

```
!$acc kernels [clause ...]
  structured code block
!$acc end kernels
```

C

```
#pragma acc directive [clause [,] clause] …]
```

Often followed by a structured code block

`kernels` construct

```
#pragma acc kernels [clause …]
{ structured code block }
```

Clauses

```
if( condition )
async( expression )
```

or data clauses

OpenACC directives syntax

Data clauses

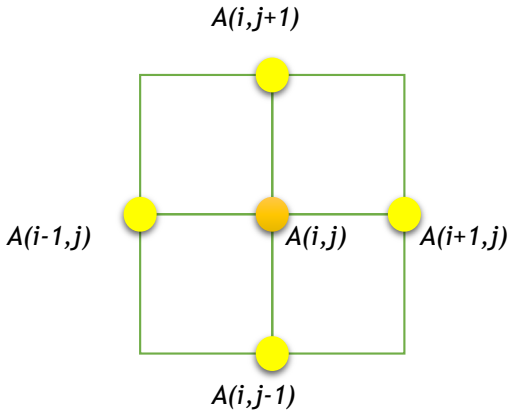
`copy ( list )`	Allocates memory on GPU and copies data from host to GPU when entering region and copies data to the host when exiting region.
`copyin ( list )`	Allocates memory on GPU and copies data from host to GPU when entering region.
`copyout ( list )`	Allocates memory on GPU and copies data to the host when exiting region.
`create ( list )`	Allocates memory on GPU but does not copy.
`present ( list )`	Data is already present on GPU from another containing data region.

and `present_or_copy[in|out]`, `present_or_create`, `deviceptr`.

OpenACC example: Jacobi iteration

Iteratively converges to correct value (e.g. Temperature),
by computing new values at each point from the average of neighboring points.

- Common, useful algorithm
- Example: Solve Laplace equation in 2D: $\Delta\varphi(x,y) = 0$



$$A_{k+1}(i,j) = \frac{A_k(i-1,j) + A_k(i+1,j) + A_k(i,j-1) + A_k(i,j+1)}{4}$$

OpenACC example: Jacobi iteration

```
while ( error > tol && iter < iter_max )
{
  error=0.0;

  for( int j = 1; j < n-1; j++) {
    for(int i = 1; i < m-1; i++) {

      Anew[j][i] = 0.25 * (A[j][i+1] + A[j][i-1] +
                           A[j-1][i] + A[j+1][i]);

      error = max(error, abs(Anew[j][i] - A[j][i]);
    }
  }

  for( int j = 1; j < n-1; j++) {
    for( int i = 1; i < m-1; i++ ) {
      A[j][i] = Anew[j][i];
    }
  }

  iter++;
}
```

Iterate until converged

Iterate across matrix elements

Calculate new value from neighbors

Compute max error for convergence

Swap input/output arrays

OpenACC example: Jacobi iteration – first attempt

```
while ( error > tol && iter < iter_max )
{
  error=0.0;

  #pragma acc kernels
  for( int j = 1; j < n-1; j++) {
    for(int i = 1; i < m-1; i++) {

      Anew[j][i] = 0.25 * (A[j][i+1] + A[j][i-1] +
                           A[j-1][i] + A[j+1][i]);

      error = max(error, abs(Anew[j][i] - A[j][i]);
    }
  }

  #pragma acc kernels
  for( int j = 1; j < n-1; j++) {
    for( int i = 1; i < m-1; i++ ) {
      A[j][i] = Anew[j][i];
    }
  }

  iter++;
}
```

Execute GPU kernel for loop nest

Execute GPU kernel for loop nest

OpenACC example: Jacobi iteration – first attempt

Compiler output

```
pgf90 -acc -ta=nvidia -Minfo=accel -o jacobi-pgf90-acc-v1.x jacobi-acc-v1.f90

```

22.5 seconds

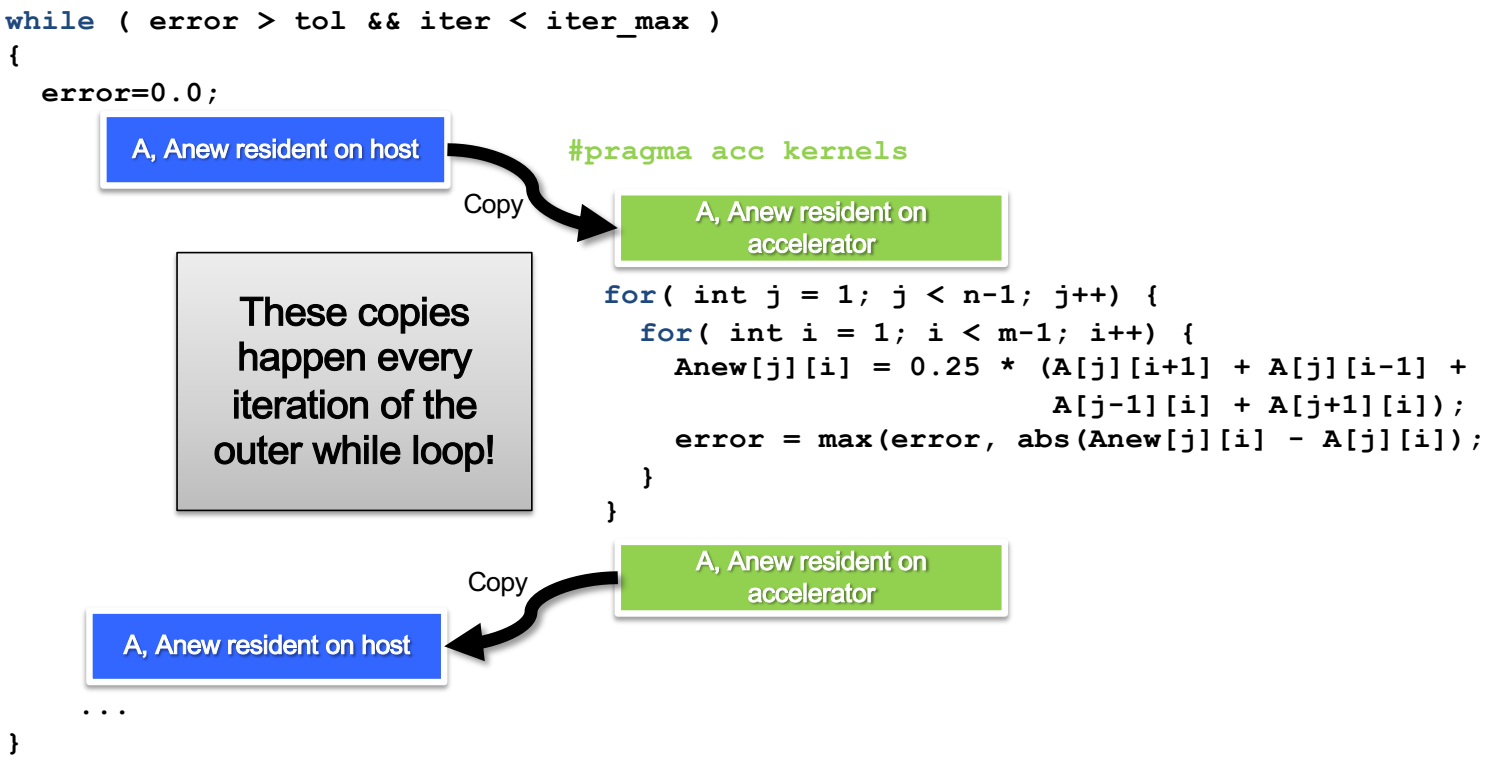
1.5 seconds

What went wrong?

- We spent all the time with data transfers between host and device

OpenACC example: Jacobi iteration – first attempt

Excessive data transfers



OpenACC example: Jacobi iteration – second attempt

```
#pragma acc data copy(A), create(Anew)
while ( error > tol && iter < iter_max ) {
  error=0.0;

#pragma acc kernels
  for( int j = 1; j < n-1; j++) {
    for(int i = 1; i < m-1; i++) {

      Anew[j][i] = 0.25 * (A[j][i+1] + A[j][i-1] +
                           A[j-1][i] + A[j+1][i]);

      error = max(error, abs(Anew[j][i] - A[j][i]);
    }
  }

#pragma acc kernels
  for( int j = 1; j < n-1; j++) {
    for( int i = 1; i < m-1; i++ ) {
      A[j][i] = Anew[j][i];
    }
  }

  iter++;
}
```

Copy A in at beginning of loop, out at end. Allocate Anew on accelerator

OpenACC example: Jacobi iteration – second attempt

pgcc 17.5-0

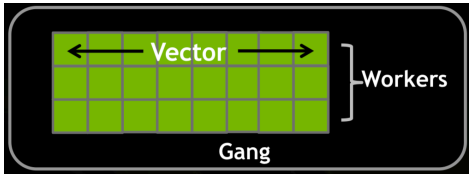
CPU flags:
-fastsse -O3 -mp [-Minfo=mp]

GPU flags:
-acc [-Minfo=accel]

CPU Speedup vs. 1 CPU core

GPU Speedup vs. 6 CPU cores

More OpenACC



- OpenACC gives us more detailed control over parallelization
  - Via **`gang`**, **`worker`**, and **`vector`** clauses
  - Gang corresponds to block, shares resources such as cache, streaming multiprocessor etc)
  - Vector threads work in lockstep (warp)
  - Workers compute a vector, correspond to threads
- By understanding more about OpenACC execution model and GPU hardware organization, we can get higher speedups on this code
- By understanding bottlenecks in the code via profiling, we can reorganize the code for higher performance

More OpenACC

Finding and exploiting parallelism in your code

- (Nested) for loops are best for parallelization
- Large loop counts needed to offset GPU/memcpy overhead
- Iterations of loops must be independent of each other
  - To help compiler: **`restrict`** keyword (C), **`independent`** clause
- Compiler must be able to figure out sizes of data regions
  - Can use directives to explicitly control sizes
- Pointer arithmetic should be avoided if possible
  - Use subscripted arrays, rather than pointer-indexed arrays.
- Function calls within accelerated region must be inlineable.

More OpenACC

Tips and Tricks

- (PGI) Use time option to learn where time is being spent
  `-ta=nvidia,time`
- Eliminate pointer arithmetic
- Inline function calls in directives regions
  (PGI): `-Minline` or `-Minline=levels:N`
- Use contiguous memory for multi-dimensional arrays
- Use data regions to avoid excessive memory transfers
- Conditional compilation with `_OPENACC` macro

SDSC Expanse GPU Nodes

                                                  822   725
```

SDSC Expanse GPU nodes

- The GPU nodes can be accessed via either the "gpu" or the "gpu-shared" partitions.

```
#SBATCH -p gpu
```

or

```
#SBATCH -p gpu-shared
```

- In addition to the partition name (required), the type of gpu (optional) and the individual GPUs are scheduled as a resource.

```
#SBATCH --gres=gpu[:type]:n
```

- GPUs will be allocated on a first available, first schedule basis.

SDSC Expanse GPU nodes

- GPU modes can be controlled for jobs in the "gpu" partition.
- By default, the GPUs are in non-exclusive mode and the persistence mode is 'on'.
  - If a particular "gpu" partition job needs exclusive access the following options should be set in your batch script:
    - #SBATCH --constraint=exclusive
      To turn persistence off add the following line to your batch script:
    - #SBATCH --constraint=persistenceoff
- GPU charging equation will be:
  - GPU SUs = (Number of GPUs) x (wallclock time)

SDSC Expanse GPU nodes

- Load CUDA module and check Nvidia CUDA C compiler. Note that you must first load the gpu module.
  (available CUDA versions: cuda10.2)

```
[agoetz@exp-59 ~]$ module load gpu/0.15.4
[agoetz@exp-59 ~]$ module load cuda
[agoetz@exp-59 ~]$ nvcc --version
nvcc: NVIDIA (R) Cuda compiler driver
Copyright (c) 2005-2015 NVIDIA Corporation
Built on Mon_Feb_16_22:59:02_CST_2015
Cuda compilation tools, release 7.0, V7.0.27
```

- Load PGI module and check PGI C compiler

```
[agoetz@exp-59 ~]$ module load pgi
[agoetz@exp-59 ~]$ pgcc --version

pgcc 17.5-0 64-bit target on x86-64 Linux -tp haswell
PGI Compilers and Tools
Copyright (c) 2017, NVIDIA CORPORATION.  All rights reserved.
```

SDSC Expanse GPU Nodes

This reservation is active on 02/05/2021 from 1 pm to 6 pm

- Interactive access to GPU nodes

```
agoetz@login02:~> srun --pty --nodes=1 --ntasks-per-node=1 --cpus-per-task=10 \
                  -p gpu-debug --gpus=1 -t 00:10:00 -A sds173 /bin/bash
```

- Check available GPUs using Nvidia system management interface

```
[agoetz@exp-59 ~]$ nvidia-smi

```

- The nodes of the shared GPU queue are configured for the CUDA runtime to use only the requested number of GPUs.
- Check environment variable `CUDA_VISIBLE_DEVICES` for the GPU that has been assigned to you.

SDSC Expanse GPU nodes: updated 2/5/21

CUDA Toolkit Samples

- Install CUDA Toolkit code samples (does not require GPU node access)

```
[agoetz@exp-59 ~]$ cp -r /cm/shared/apps/cuda10.2/sdk/10.2.89 ./NVIDIA_CUDA_10.2.89_Samples
Copying samples to ./NVIDIA_CUDA-7.0_Samples now...
Finished copying samples.
```

- Explore CUDA Toolkit samples – great resource!

```
[agoetz@exp-59 ~]$ cd NVIDIA_CUDA_10.2.89_Samples /
[agoetz@exp-7-59 NVIDIA_CUDA_10.2.89_Samples]$ ls
0_Simple     2_Graphics  4_Finance      6_Advanced       common    Makefile
1_Utilities  3_Imaging   5_Simulations  7_CUDALibraries  EULA.txt
```

- Compile CUDA Toolkit samples

```
[agoetz@exp-7-59 NVIDIA_CUDA_10.2.89_Samples]$ make -j 6
make[1]: Entering directory `/home/agoetz/NVIDIA_CUDA-
7.0_Samples/0_Simple/simpleMultiCopy'
